Contents

- Metrology in High-Energy Mixed Radiation Fields
- Metrology
 - Comparison between experiment and Monte Carlo simulation for
 - High-pressure ionisation chambers (H, Ar filled)
 - Air filled plastic ionisation chambers
 - Recombination effects
- Technique
 - Read-out electronics: charge digitizer
- Conclusion

Radiation Protection Task

- Radiological survey of work places:
 - Measurement of ambient dose equivalent $H^*(10)$ [Sv] in pulsed, high energy, mixed radiation fields
- Challenge:
 - Correct
 - Reliable
 - State-of-the-art
 - Compliant with international standards and legal requirements
- Radiation Monitoring System for the Environment and Safety for LHC (RAMSES)

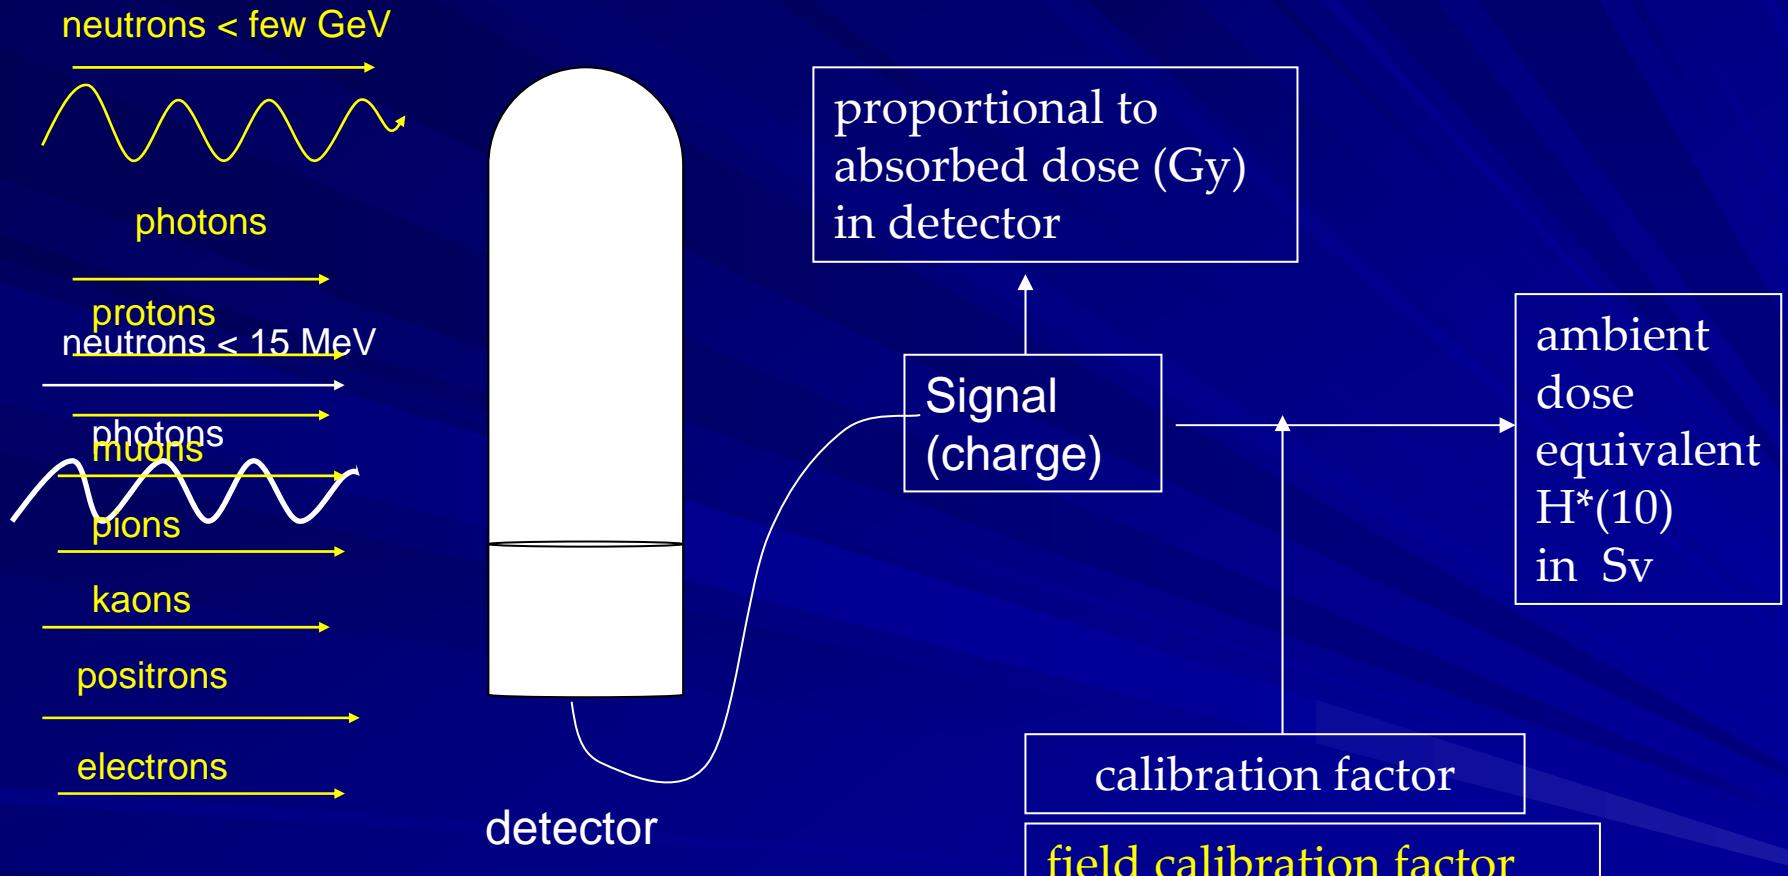

Monitoring of Ionising Radiation

Monitoring of dose rates caused by
by

- Prompt radiation (beam on)
- Induced radioactivity (beam off)
off)

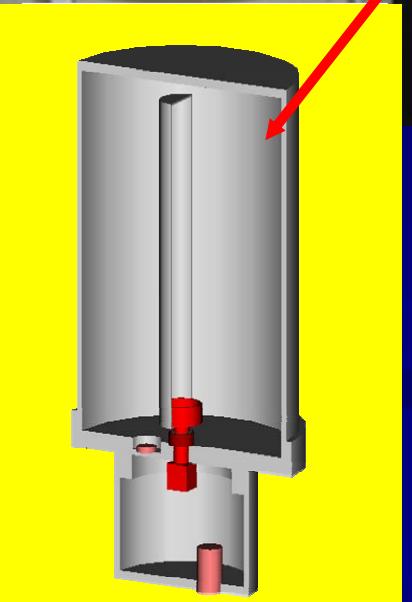

Mixed High-Energy Radiation Fields

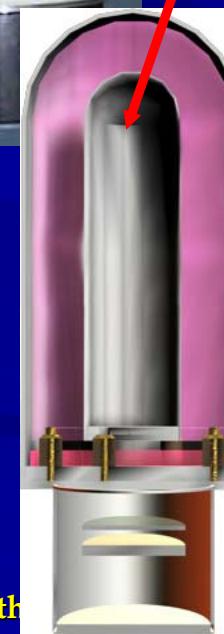

Detector response to mixed fields?

=> Experiment \Leftrightarrow Monte Carlo simulation

Comparison of Experiment and Simulations

PMI
wall: C-H₂
volume: 3 l
gas: air, 1 atm
voltage: 400 V

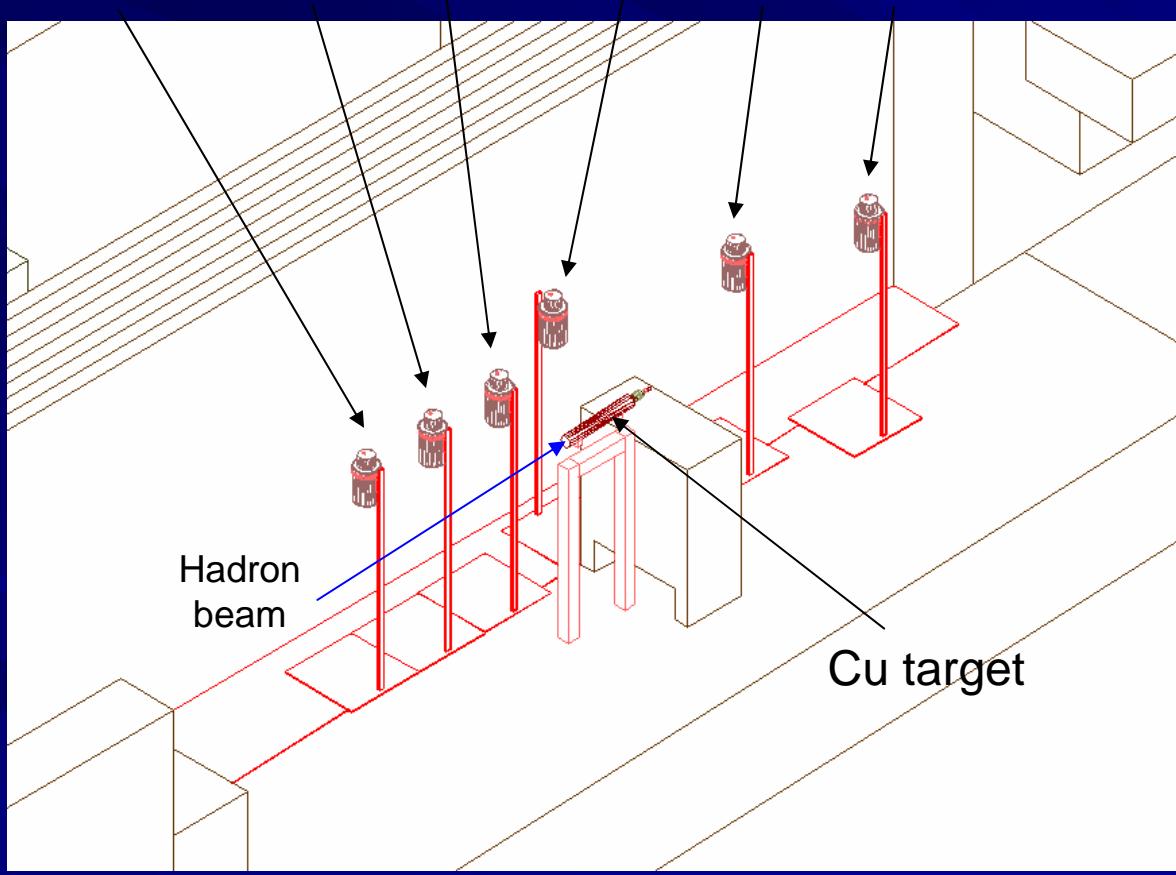

IG5
High-pressure ionisation chamber
volume: 5,2 l active
gas: Ar or H (20 bar)
high-voltage: 1200 V

Set-up in the CERF Target Area (PMIs)

SPS secondary hadron beam is hitting a copper target → irradiation of the PMI chambers with different radiation fields at various positions.

EPAC 2004 - Doris Forkel-Wirth

Beam parameters:

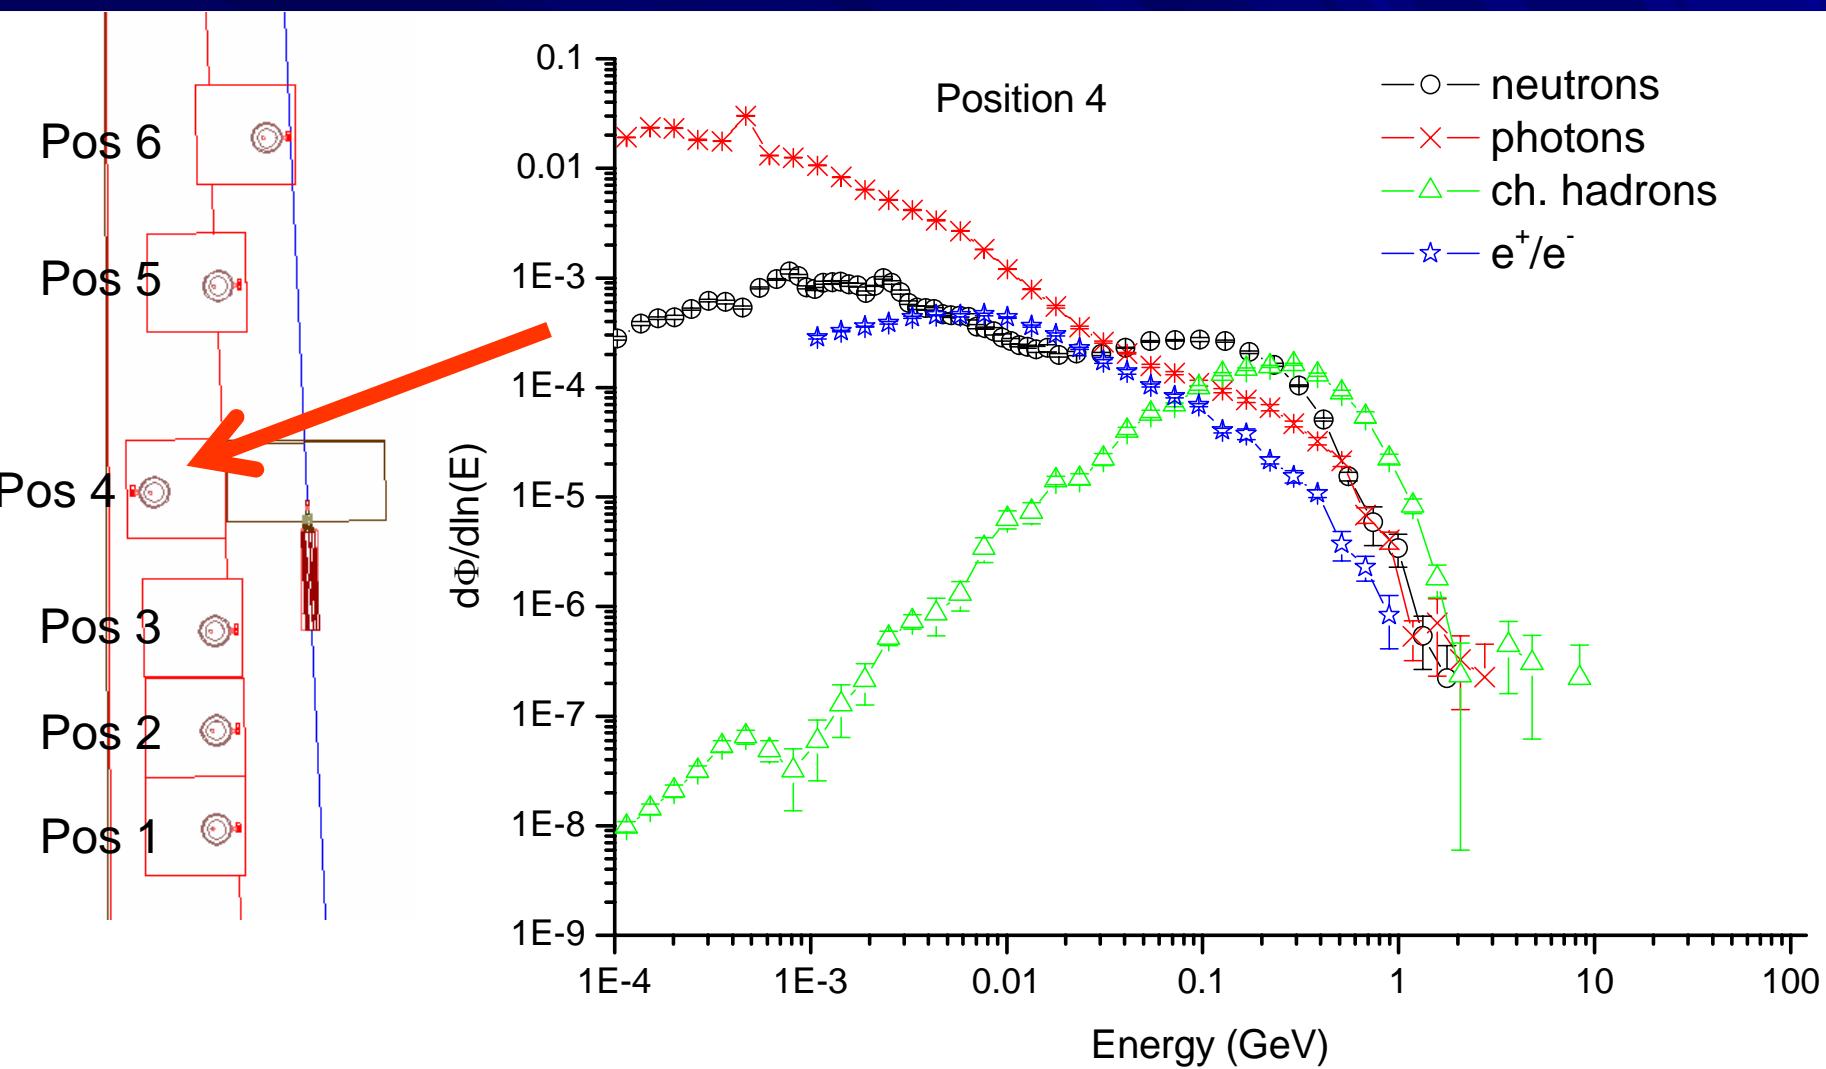

- Momentum:
120 GeV/c
- Intensity:
9*10⁷ hadrons/ SPS cycle (16.8 s with 4.8 s continuous beam)
- Composition:

60.7%	π^+
34.8%	p
4.5%	K^+

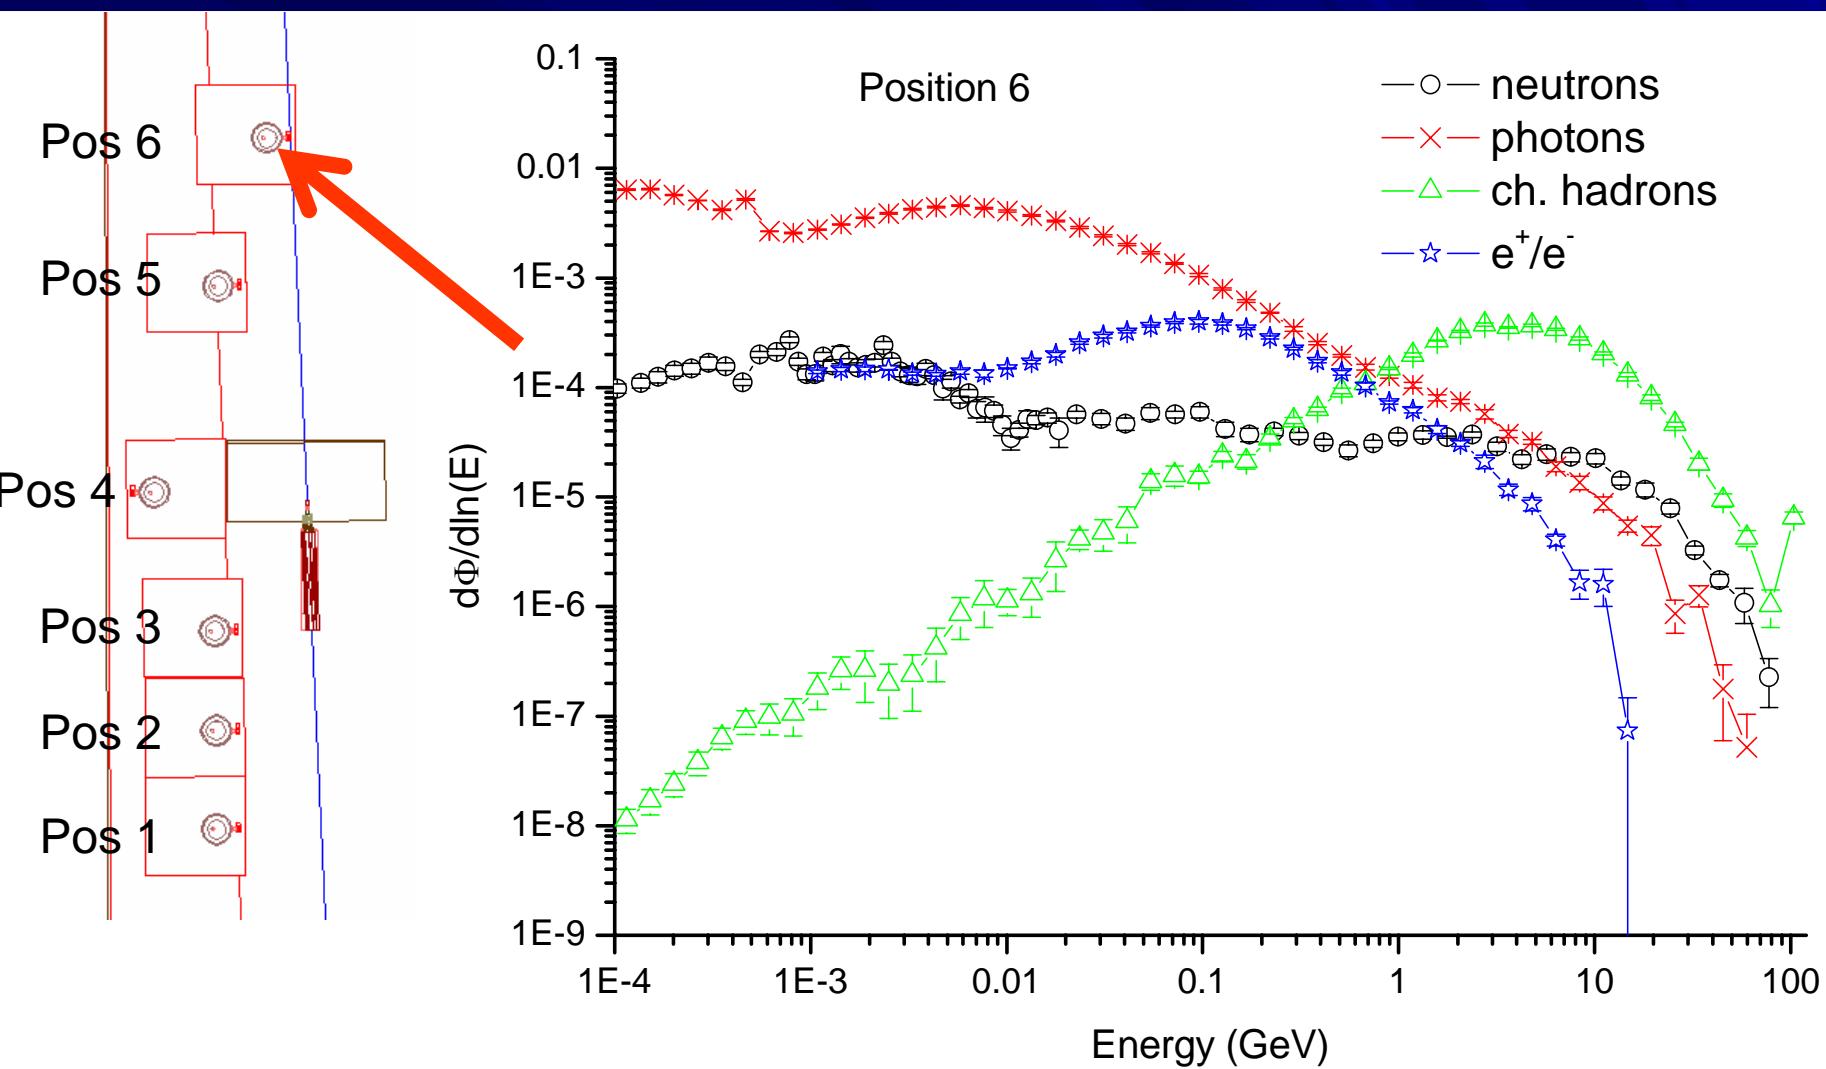

Simulation of Particle Fluences

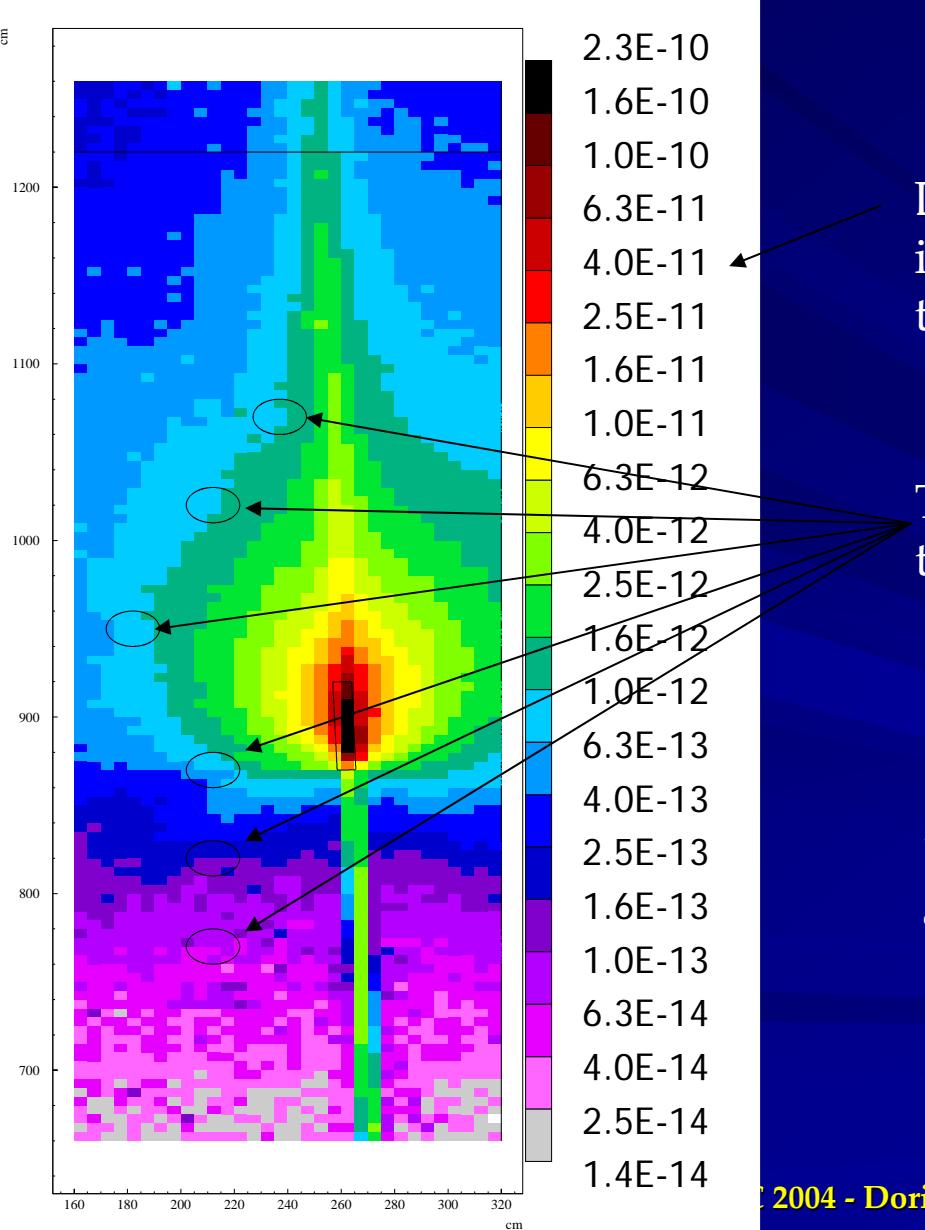

Simulation of Particle Fluences

Simulation of Particle Fluences

Simulated Dose Distribution

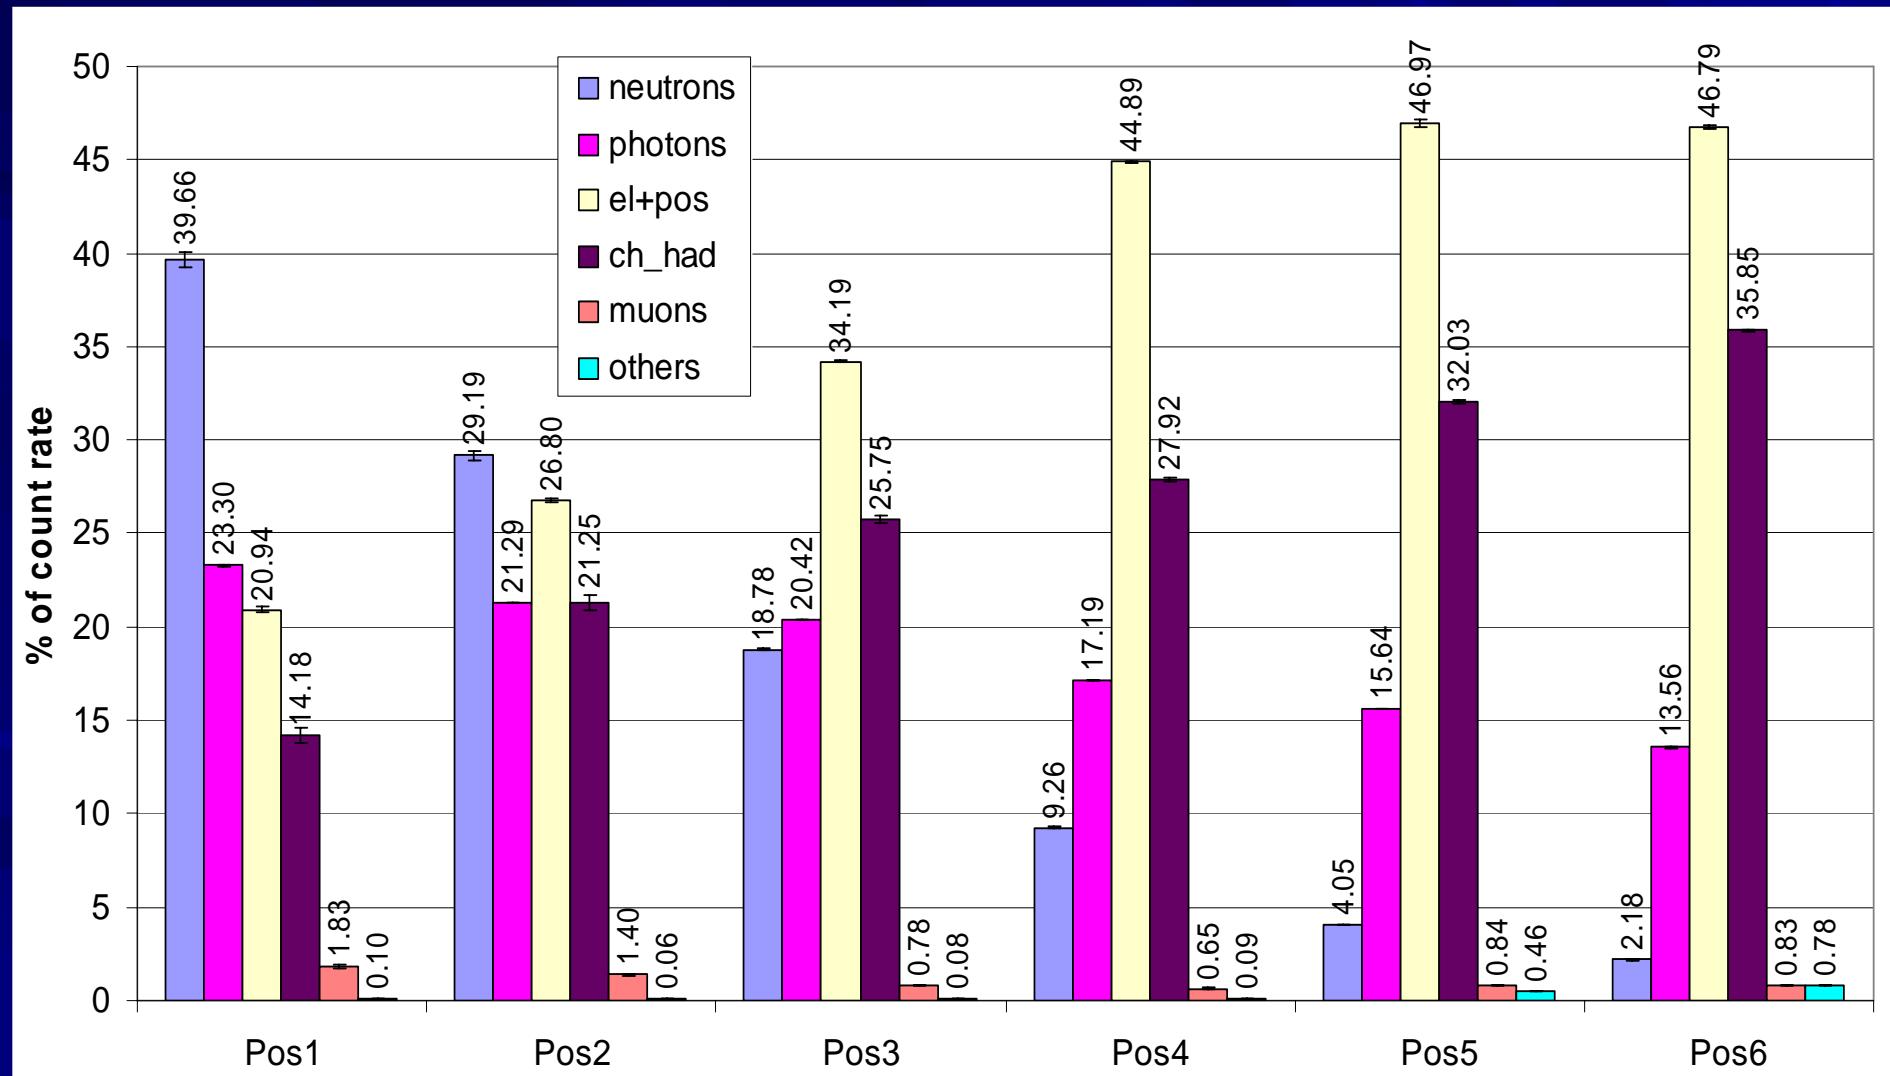

Dose (average within ± 10 cm) given in Gy per primary particle hitting the target.

The circles indicate the positions of the chambers.

$1 \text{ pC} = 10 \text{ nGy}$ deposited in active volume

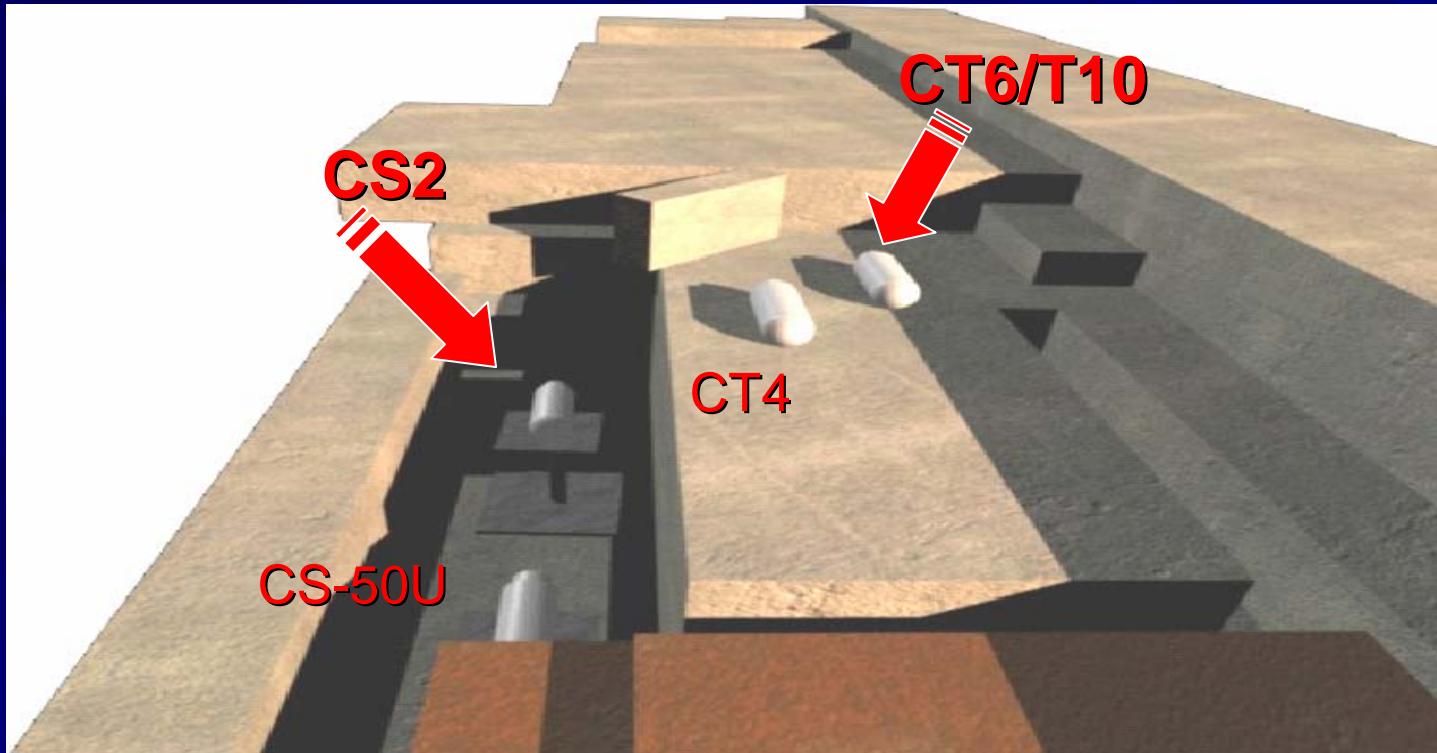

Contribution of the Different Particle Types to the Energy Deposition

Comparison simulation and experiment

	Simulation Counts/ prim. part. $\times 10^{-6}$	Simulation error $\times 10^{-6}$	Measurement Counts/ prim. part. $\times 10^{-6}$	Measurement error $\times 10^{-6}$	Simulation/ Measurement	Error
Pos 1	5,63	$\pm 0,12$	5,64	$\pm 0,56$	0.998	± 0.102
Pos 2	16,06	$\pm 0,44$	15,58	$\pm 1,56$	1.031	± 0.107
Pos 3	67,46	$\pm 0,73$	67,25	$\pm 6,93$	1.003	± 0.104
Pos 4	85,33	$\pm 0,64$	79,00	$\pm 8,67$	1.080	± 0.119
Pos 5	96,20	$\pm 1,26$	89,39	$\pm 9,47$	1.076	± 0.115
Pos 6	108,31	$\pm 0,82$	115,74	$\pm 17,99$	0.936	± 0.146

The IG5 at CERF

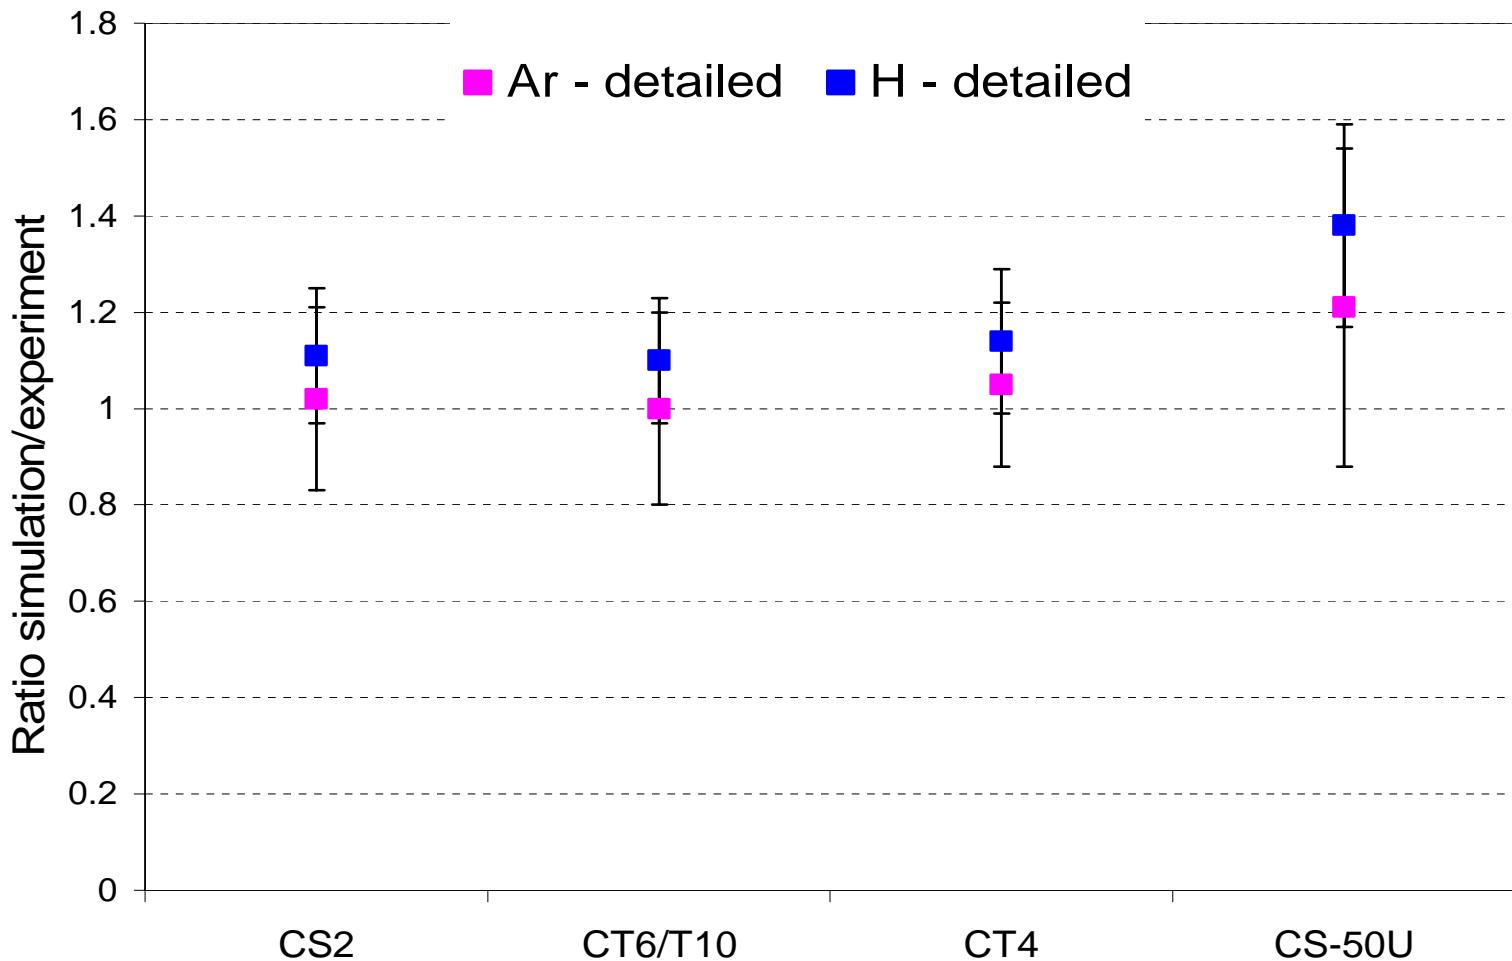

80 cm of concrete between detector and target

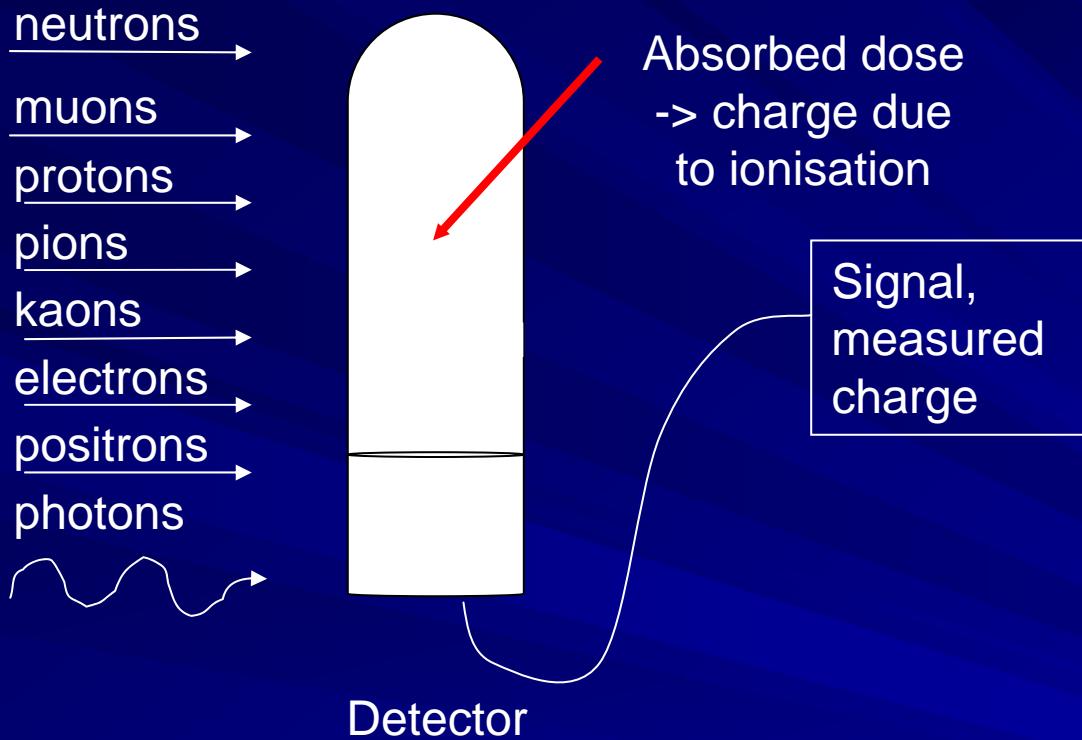

Particle fluence at CT6/T10

Comparison simulation & experiment for IG5

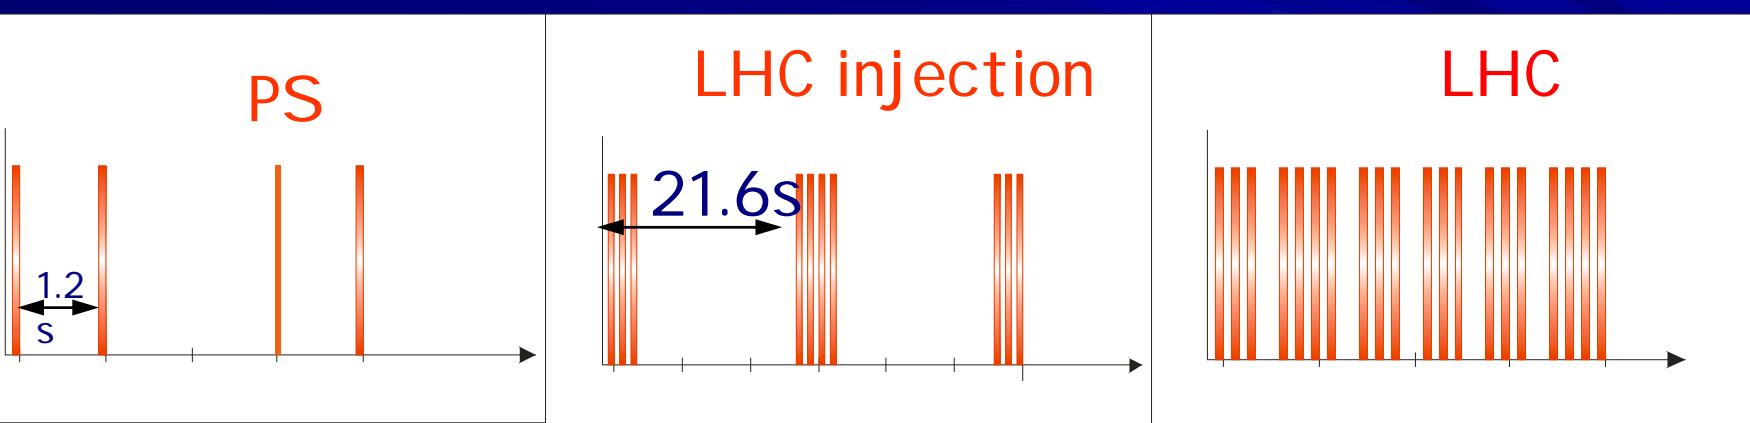

Dose Measurements in Pulsed Fields

Problem in case of
short pulses:

Recombination
effects (charge loss)

Underestimation of
absorbed dose

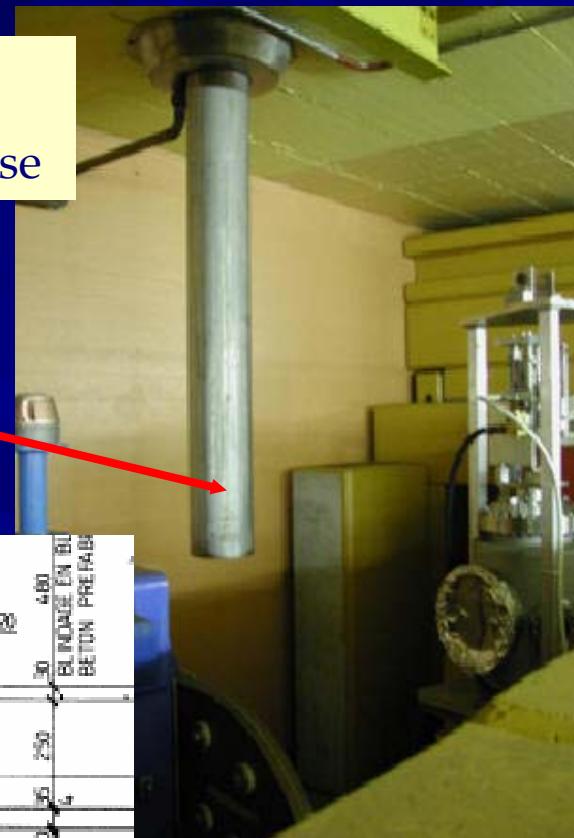

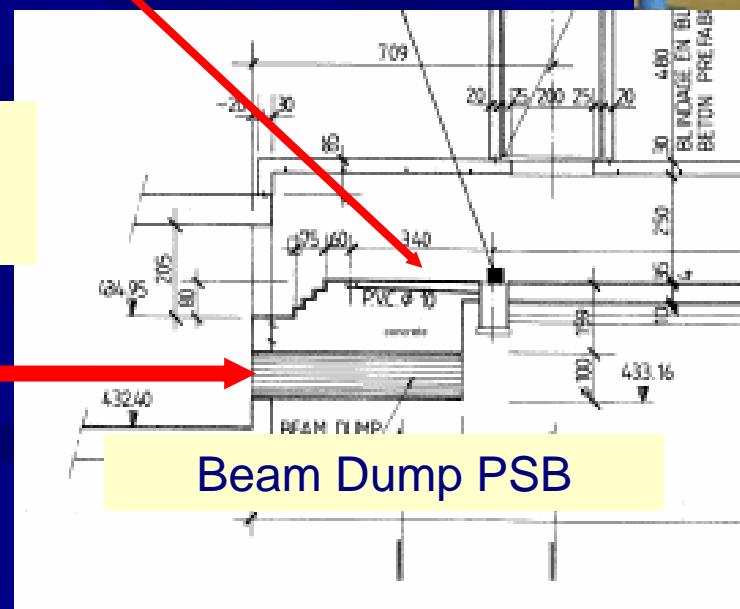

Recombination effects

Ionisation chambers
exposed to pulsed, high
energy mixed radiation
fields:

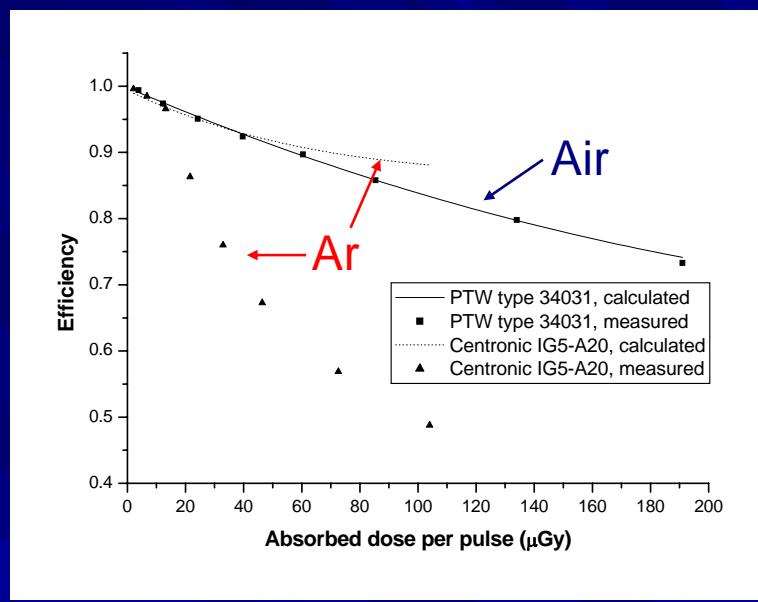

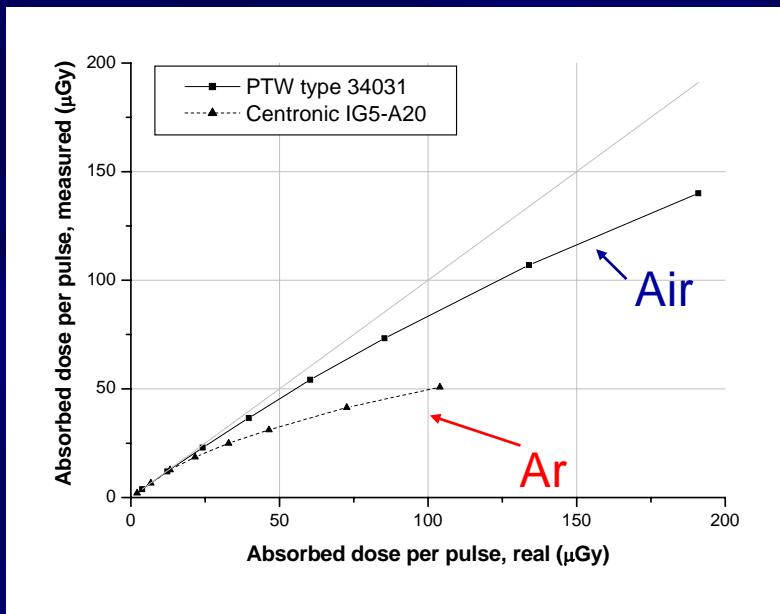

AD:
up to 50 mGy/pulse

PSB:
up to 160 μ Gy/pulse

Proton beam

Recombination effects

Experiment agrees well with recombination model of W. Boag (ICRU 34) for air and H
(the model is not applicable for Ar)

90 % ion collection efficiency level

Ar	$\sim 15 \mu\text{Gy}/\text{pulse}$
H	$\sim 250 \mu\text{Gy}/\text{pulse}$
Air	$\sim 50 \mu\text{Gy}/\text{pulse}$

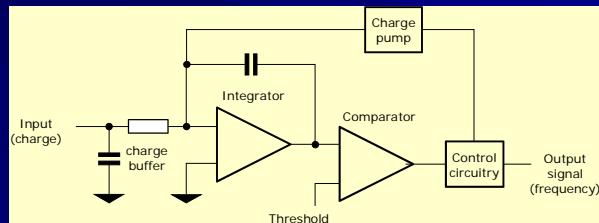

Read-Out Electronics

For pulsed fields the read-out electronics has to be based on charge digitizers

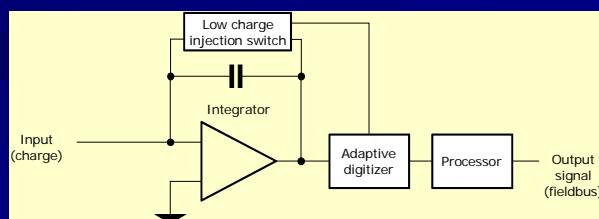

Range to be covered:

10^{-14} A (background level) - 10^{-5} A

Switching not permitted!

Present CERN electronics covers
5 – 6 decades

Newly developed: 9 – 10 decades
First tests: electronics measures reliably up to
 $300 \text{ nC/pulse} \sim 50 \text{ mGy/hour}$ (LHC injection)

Conclusion

- Response of ionisation chambers to pulsed, mixed high energy radiation fields is very well understood
- Detector response to LHC radiation fields can be extrapolated by Monte Carlo simulations
- Studies will be used to define RP standards in the field of radiation monitoring around particle accelerators
- Adequate read-out electronics is developed to cover a wide measuring range
- “*Pulse per pulse*” data locking possible
- Air filled plastic ionisation chambers can be used for on-line monitoring of high doses inside the tunnel or the experiments

- Further studies: optimisation of the detector design by Monte Carlo simulations (variation of fill gases, walls...)

- All radiation protection competencies, experience and tools exist to survey properly the LHC
