---

# Outline

---

- Overview of Beam-Beam Effects
- New Collision Helix
- Second Order Chromaticity Correction
- Results and Summary

# Overview of Beam-Beam Effects

## Beam Intensities in Store 5506

## Luminosity and Luminosity Integral

$$L = \frac{3\gamma f_0 B N_{\bar{p}} N_p}{\pi\beta^* (\varepsilon_p + \varepsilon_{\bar{p}})} H(\sigma_l / \beta^*)$$

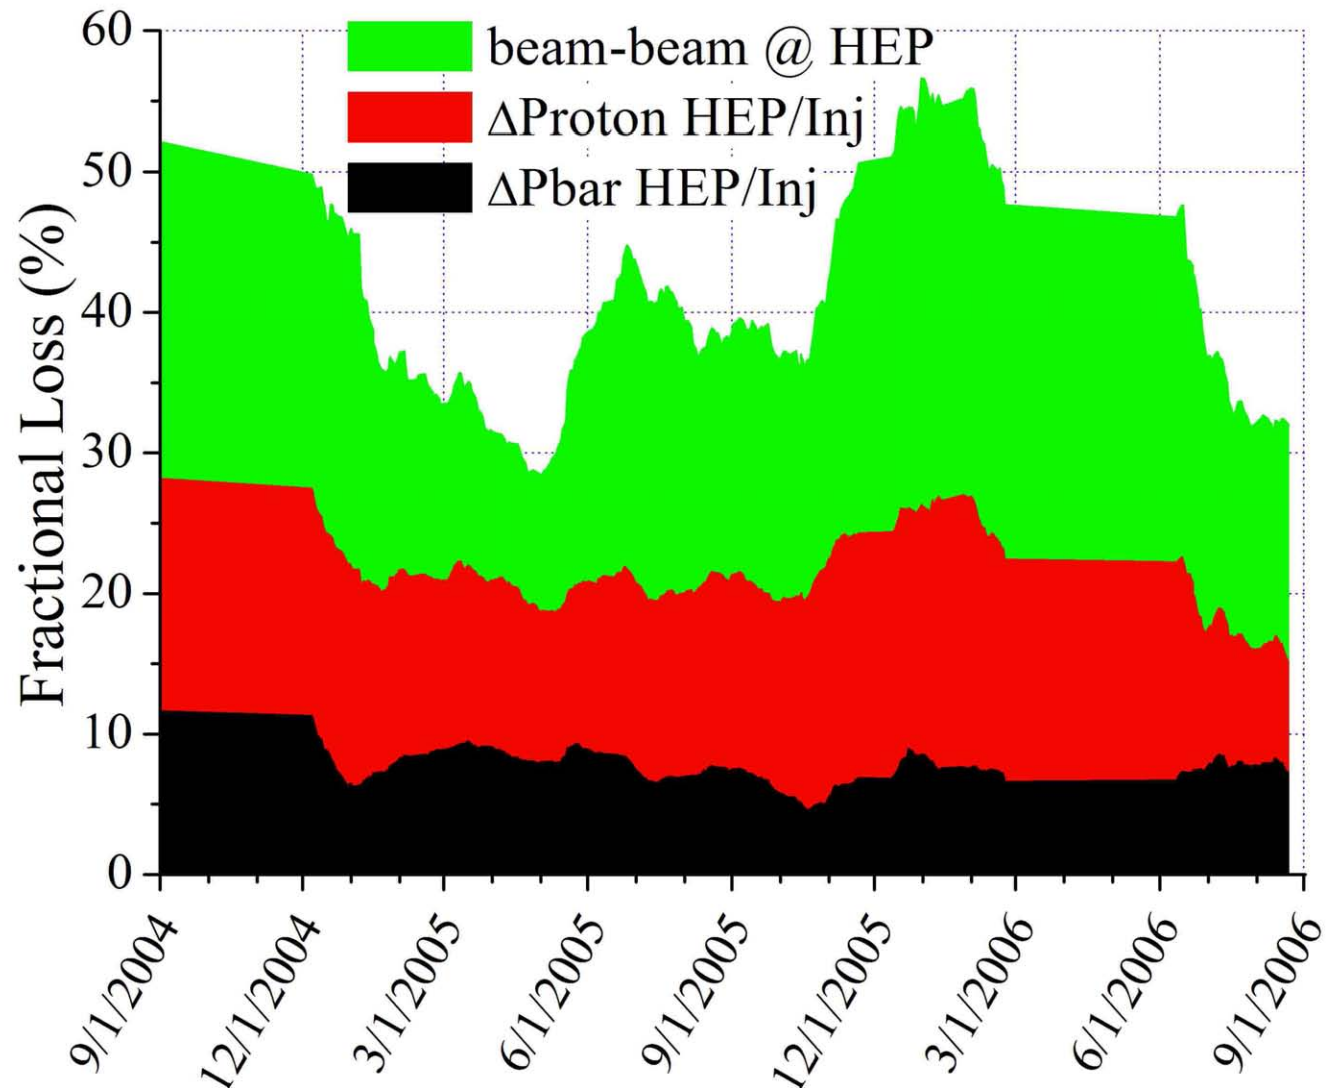

$$I = \int L dt \cong N_{stores} \tau_L L_0 \ln(1 + T / \tau_L)$$

### ■ Luminosity Integral: primary factors

- Beta\* at IP and bunchlength:  $H(x)/\beta^*$
- Emittances
- Number of protons:  $N_p$
- Number of antiprotons:  $B N_{\bar{p}}$
- Lumi-lifetime:  $\tau_L$
- Number Stores:  $N_{stores} \sim T_{week} / (T + t_{setup})$

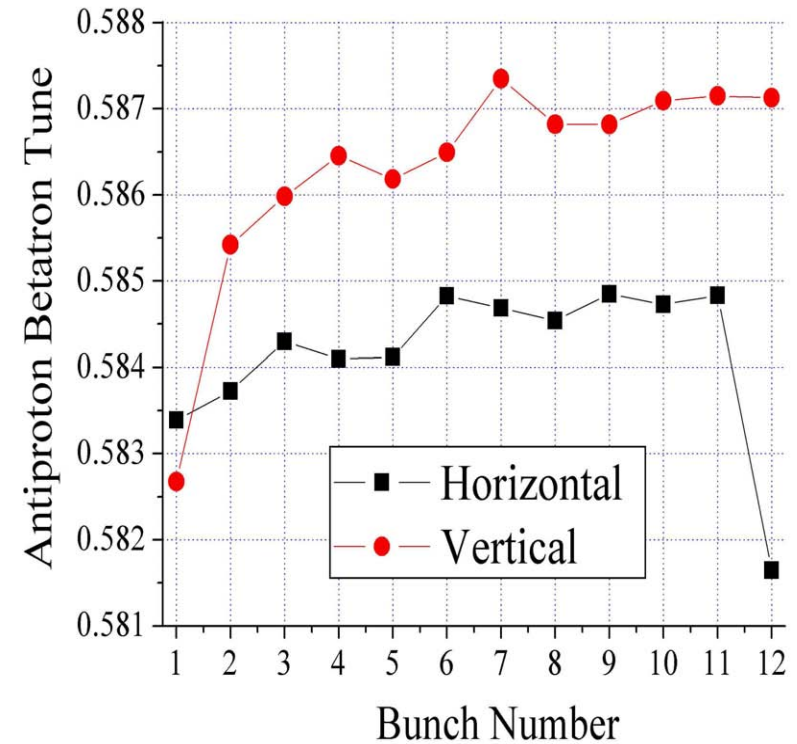

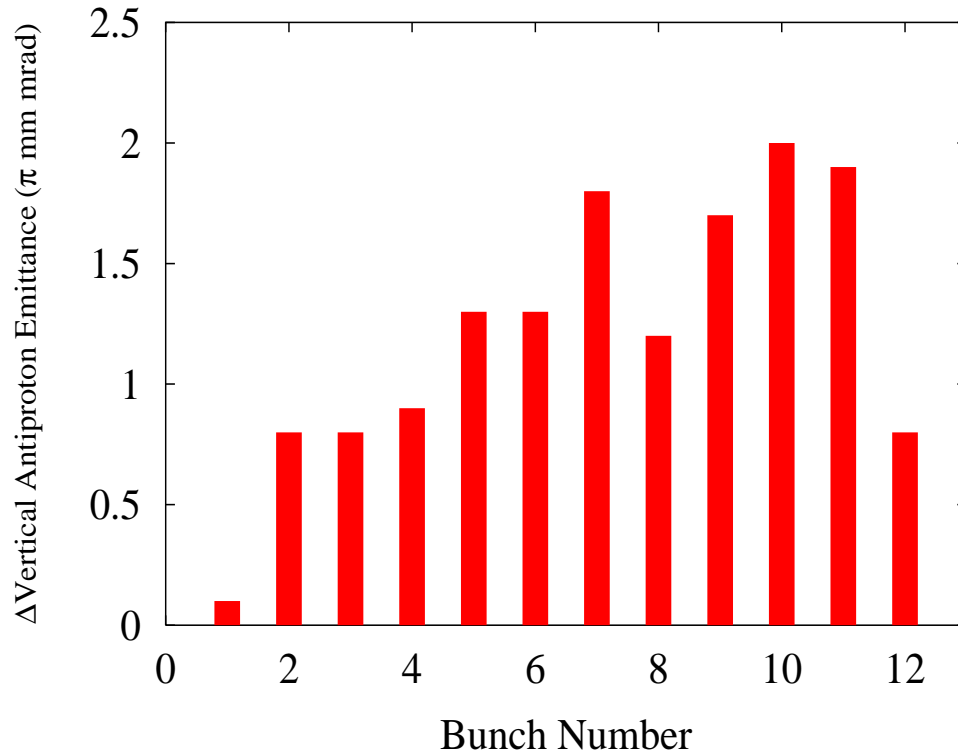

# Sources of Luminosity Loss in Tevatron

# Bunch-by-Bunch Effects
