*Field gradient, ECR zone size (I)*

## Field gradient effect

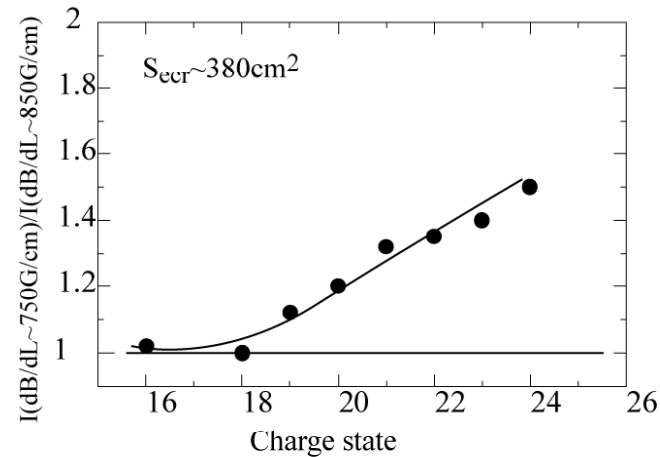

Ratio of the beam intensity between two conditions (different field gradient)

The ratio increases with increasing charge state

Electron temperature effect

## ECR zone size effect

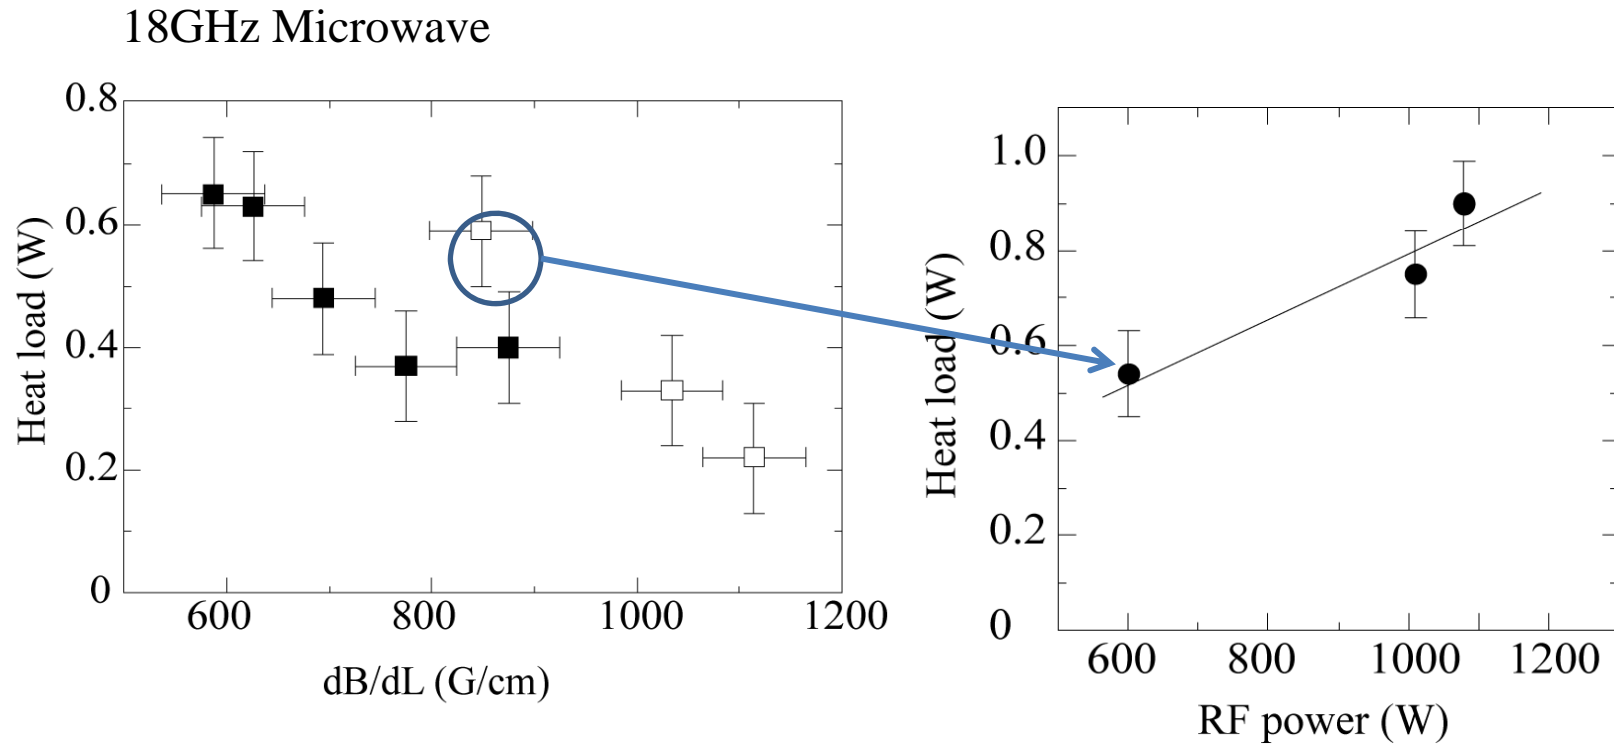

Ratio of the beam intensity between two conditions  
(different ECR zone size)

The ratio was almost constant and independent on the charge state

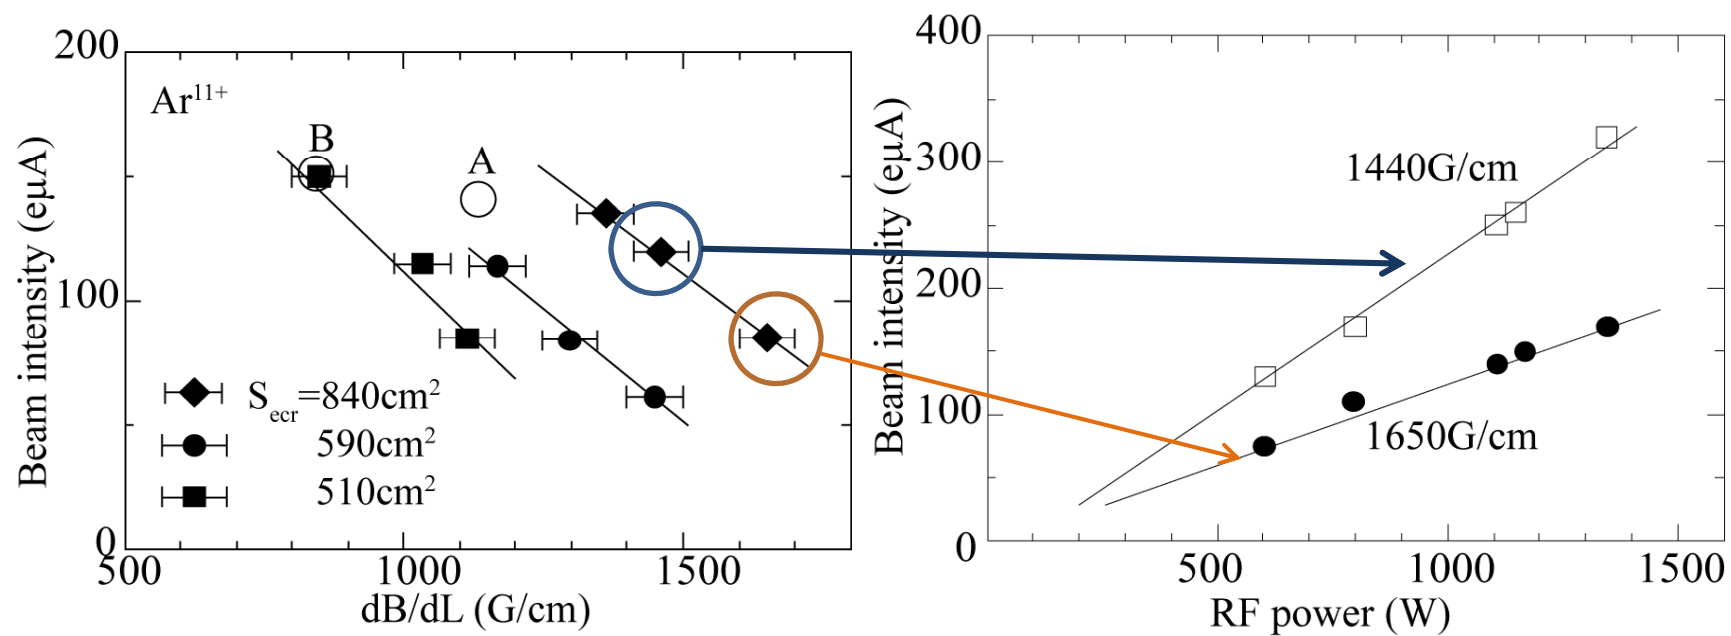

## Heat load (X-ray)

*RF power dependence (beam intensity, heat load)*

## Fokker-planck equation

Collision term

HF term

Source term

$$\frac{\partial f_e}{\partial t} = C(f_e) + Q(f_e) + S(f_e)$$

$$Q = \frac{1}{v^2} \frac{\partial}{\partial v} \left( v^2 D_{vv} \frac{\partial f_e}{\partial v} \right) + \frac{1}{v^2} \frac{\partial}{\partial \mu} \left( (1 - \mu^2) D_{\mu\mu} \frac{\partial f_e}{\partial \mu} \right)$$

$$D_{vv} = D = \frac{4}{3} \pi \left( \frac{eE}{2m_e} \right)^2 \frac{d}{L\omega}, \quad D_{\mu\mu} = D \left( \frac{v}{v_{ph}} \right)^2$$

Strength of electric field (RF power)

Magnetic field gradient (B<sub>min</sub> effect)

$$\frac{k^2 c^2}{\omega^2} \approx - \frac{\omega_p^2}{\omega k v_T}$$

Taking the phase velocity  $v_\phi = \omega/k$ , we obtain

$$v_\phi^3 \approx \frac{\omega^2}{\omega_p^2} v_T c^2 = \frac{n_c}{n_e} v_T c^2,$$

$$n_c = \frac{\omega^2 m_e \epsilon_0}{e^2}$$
