- Simultaneous measurement of beam core and beam halo
- Conclusions

## - Motivation

Beam halo : It brings serious activation of the accelerator by beam loss

### What to see?

Two-dimensional density distribution from beam core to beam halo of 3GeV Proton Beam.

Beam Intensity  $\geq 10^{13}$  proton/bunch

### What kind of instrument?

High Dynamic Range Beam Profile Monitor

Dynamic Range:  $10^6$

### What is carried out?

Beam diagnosing for injection beam of J-PARC MR which is extracted beam from RCS.

Evaluation for validity of beam collimation by the collimator

- Simultaneous measurement of beam core and beam halo
- Conclusions

# Concept (1): *Dynamic range*

Combination measurement with OTR and the fluorescence:

Beam core : Measure with OTR from 10 microns titanium foil with smaller beam loss

Beam Halo : Measure with Fluorescence from Chromium doped alumina screen

Adopting Suitable Gain of the Detector: Image Intensifier (II)

# Concept (2): *Energy loss in screen*

## Combination measurement with OTR and the fluorescence:

Beam core : Measure with OTR from 10 microns titanium foil with smaller beam loss

Beam Halo : Measure with Fluorescence from chromium doped alumina screen

Energy Loss in using material

	Energy Loss [keV/proton]*	Total Energy Loss [J/bunch]**
Titanium Foil 10 micron thick	6.7	9.8e-3
Alumina Ceramics 0.5 mm thick	330	4.7e-1 →

\* 3GeV Proton, \*\* 1e13 proton/bunch

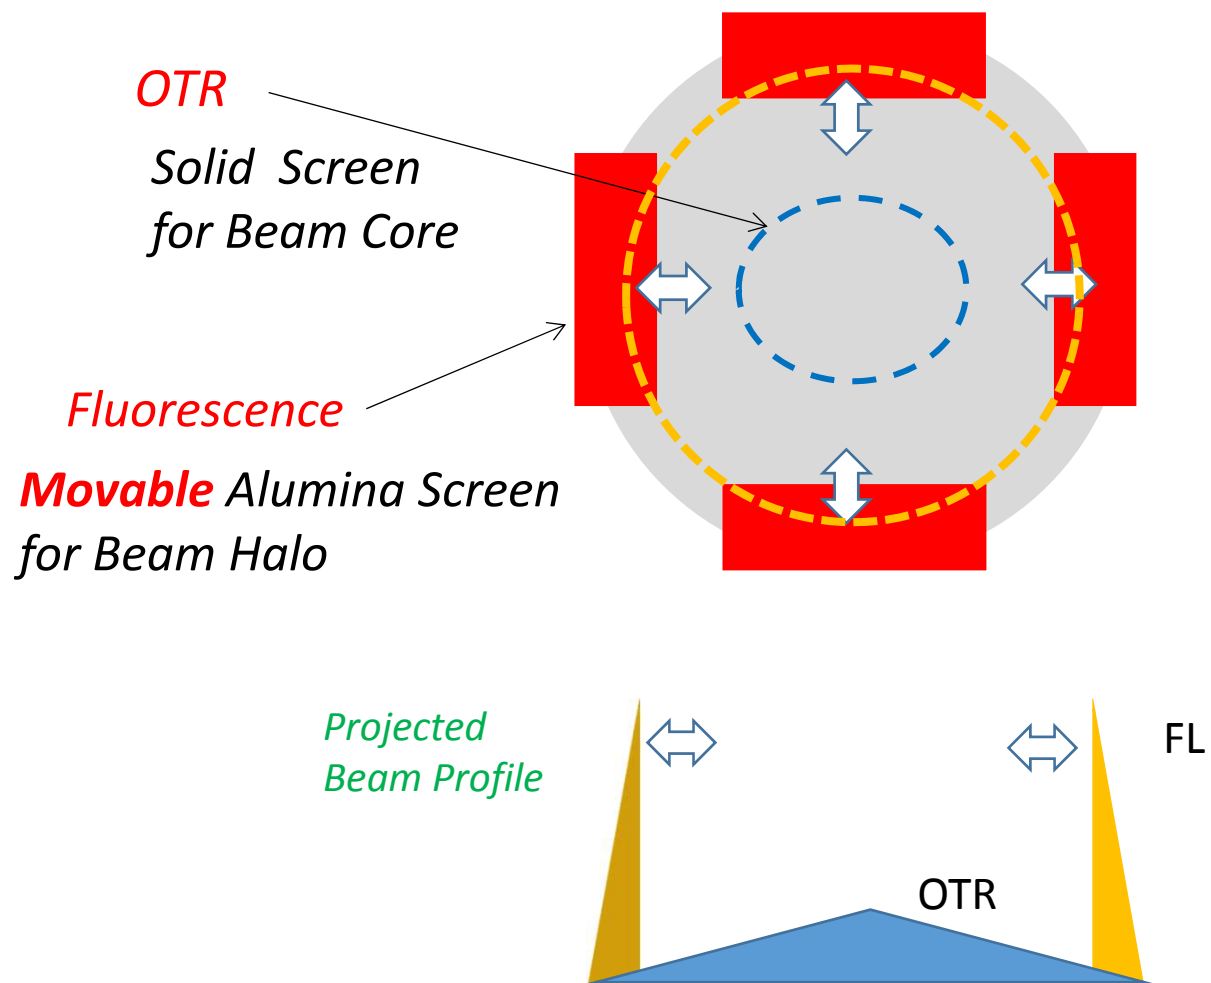

48 times larger  
than 10 micron Ti

Used in only  $10^{-2}$  region:  
4.7 e-3 [J/bunch]  
Becomes 1/2 of Ti

# Concept (3): Screen Configuration

Layout (Front View)

# Concept (4): *Screen photo (front view)*

**OTR**

*Solid Screen  
for Beam Core*

**Fluorescence**

**Movable** *Alumina Screen  
for Beam Halo*

# Concept (5): *Two Target Structures*

**New** four-direction alumina screen.

Pre-existing triple screen

→ Inserted just after four direction screen

Operate by two horizontal movable shafts.

# Concept (6): Screen Configuration-2

# Concept (7): *Fluorescence time*

Light quantity adjustment of the fluorescence from alumina screen  
longer fluorescence time of 1ms

⇒ Changing the Image Intensifier (II) Gate

Yield ratio of fluorescence and OTR can be controlled

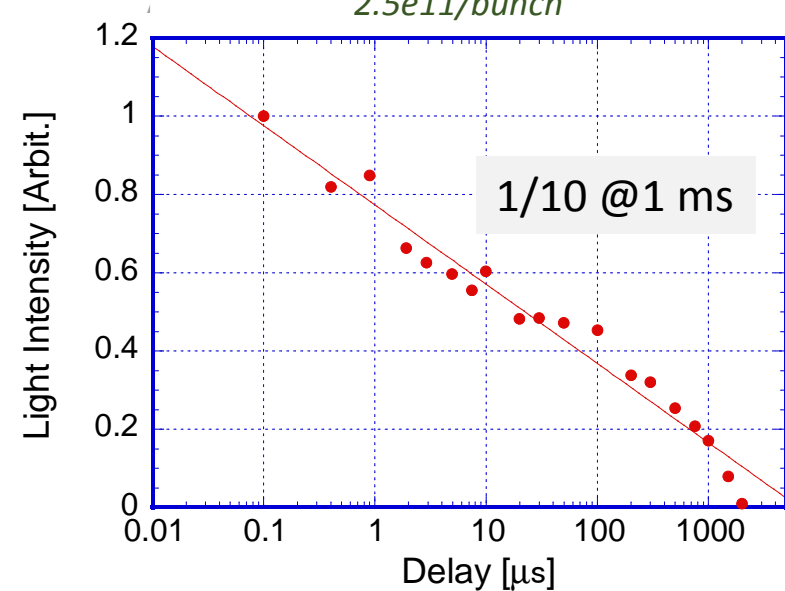

Exposure (II Gate)

*Fluorescence time of  
Cr doped Alumina Screen*

*Beam: 3GeV Proton*

*2.5e11/bunch*

# J-PARC and 3-50 BT:

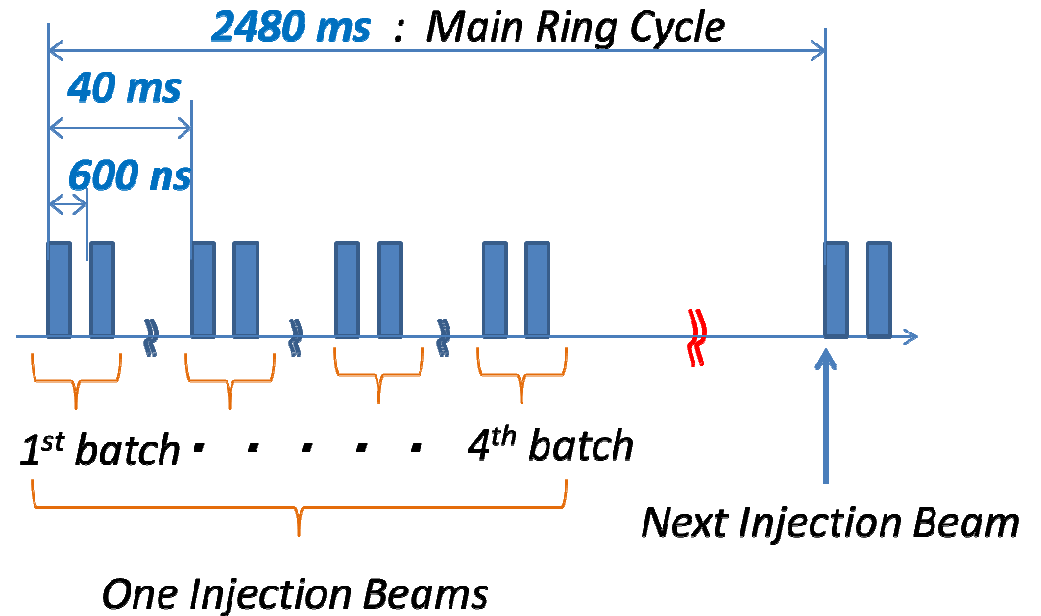

Beam Energy: 3 GeV

Beam Intensity :

$1.6 \times 10^{13}$  proton/bunch

Injection Beam:

2 bunch  $\times$  4 batch

- Our monitor usually measured 2bunch (1batch)
- Beam collimators located at 122m upper stream

## Scaling for Unified Profile (1)

For obtaining an *UNIFIED* profile : *Scaling*

Gain ratio of the image intensifier:  $G_R$

$G_R = G_{1000} / G_{SET}$  by Gain curve of the Image Intensifier

$G_{1000}$  : Gain at MCP1000V (Maximum)

$G_{SET}$  : Gain at MCP set voltage at Measurement

Yields ratio Fluorescence/OTR:  $Y_R$

OTR data  $\rightarrow$  data/ $G_R$

FL data  $\rightarrow$  data/ $Y_R / G_R$

# Scaling for Unified Profile (2)

$Y_R$ : Yields ratio between Fluorescence/OTR

Integration Ratio  
(avg.)  
 $= Y_{MR}$   
 $= 1.84 \pm 0.07$   
( $\pm 3.8\%$ )

$\times$  II gain ratio (714.3)

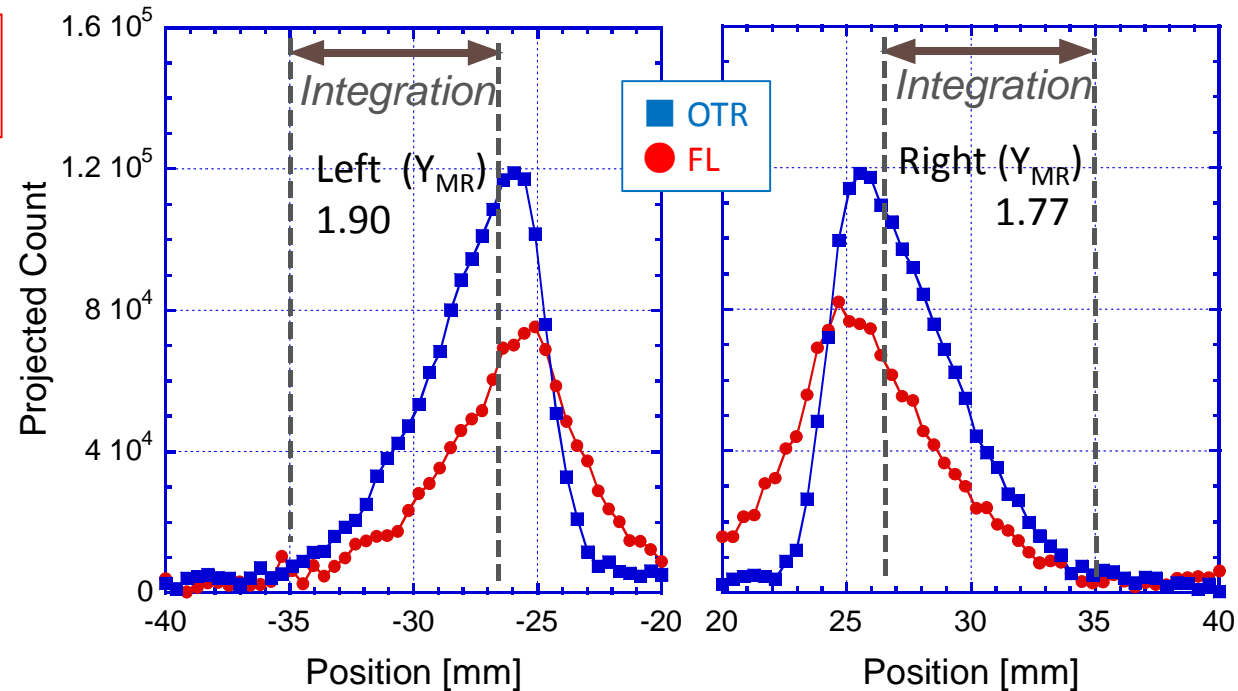

$Y_R = 1314.6$

OTR  
50 mm dia. -Hole  
Target

Fluorescence  
Alumina Target  
Edge:  $\pm 25$  mm

# Effect of the beam cut by 3-50 BT collimator (1)

Halo Measurement by 25 times Changing Position of Alumina Screen

Gain of II : optimized in each step

Superimposed Image (5 times averaged each)

Beam Condition : Intensity  $1.5 \times 10^{13}$  p/bunch,  $50 \pi$  painting at RCS Injection

Raw data (superimposed)

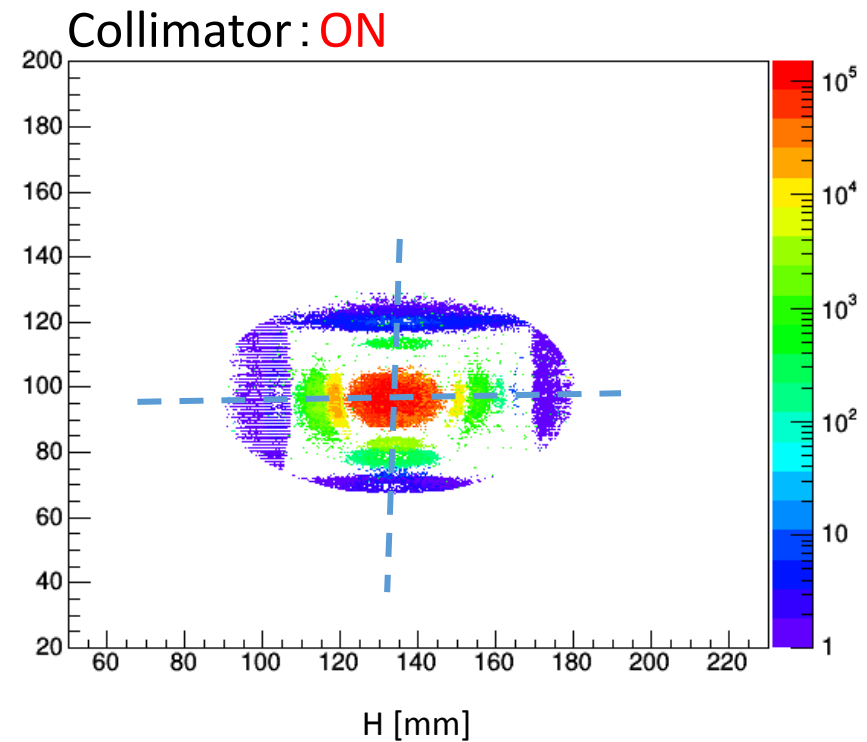

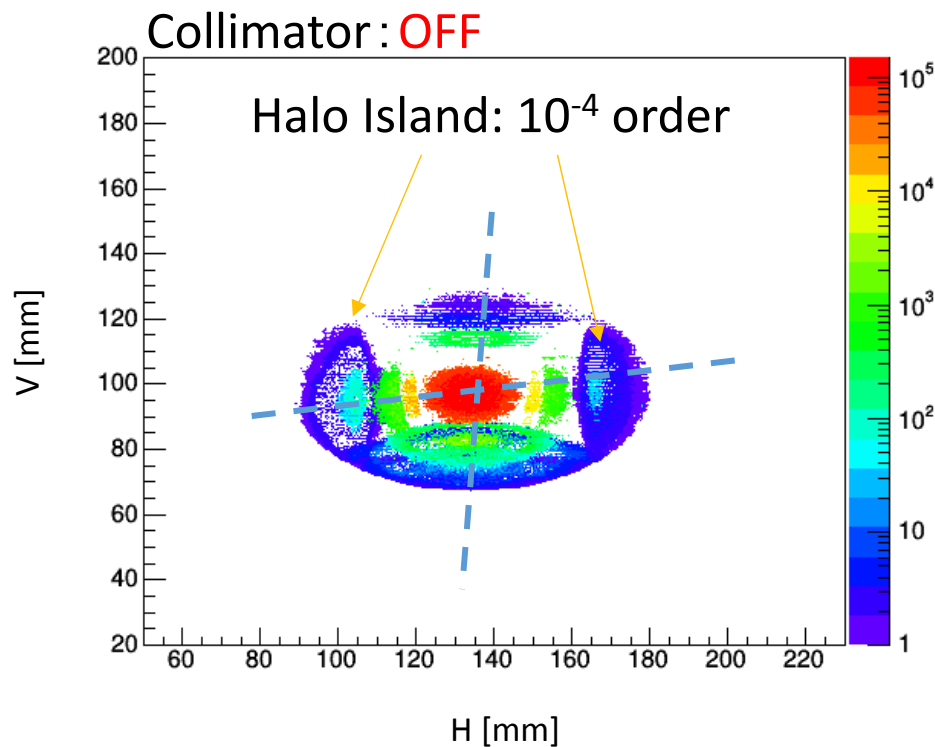

➔ Scaling

### Two-Dimensional Halo Distribution

Dynamic Range of Light Intensity: 4 to 5 order obtained.

Halo Island at Minus fourth order disappeared by Collimator ON

Left and Right Halo distribution has asymmetry.

Effect of the beam cut by 3-50 BT collimator (3)

### Horizontal Projection

Dynamic Range :More than six order obtained  
Beam Size: More than 120 mm at  $10^{-6}$  order

Horizontal

Collimator OFF

Collimator ON

Collimator-ON

Waist appears at  $10^{-4}$   
Expansion at  $10^{-6}$

# Effect of the beam cut by 3-50 BT collimator (4)

# Simultaneous Measurement of Beam Core and Beam Halo (1)

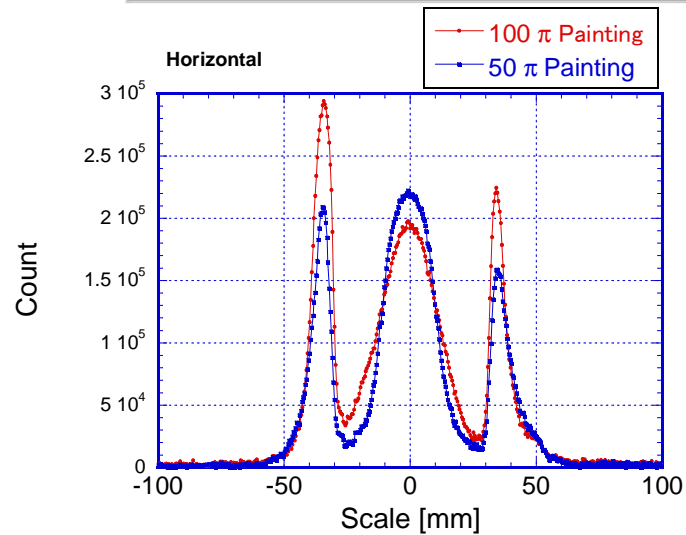

## Alumina Edge Position : Halo of $10^{-4}$ order

Difference by Painting Area of RCS Injection of  $100\pi$  and  $50\pi$  [mm.mrad]

Beam Intensity:  $2.99e13/2\text{bunch}$  5 times averaged

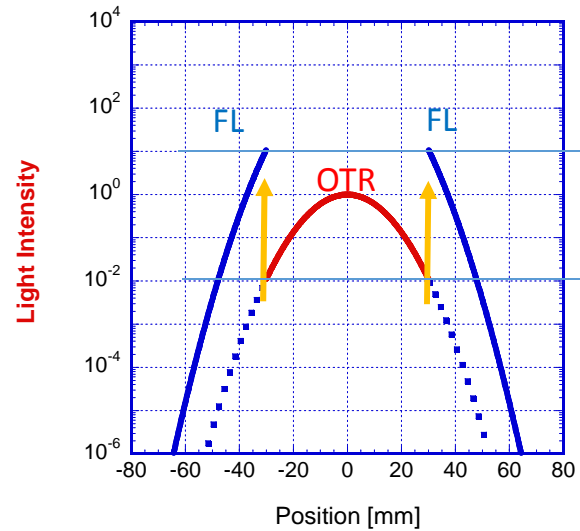

- 50  $\pi$  Painting
- Smaller Beam Size
  - Halo Rotation

Simultaneous measurement of beam core and beam halo (2) :  
as possible as seamlessly (Next step)

Light Yield Ratio : Fluorescence /OTR  $\rightarrow 1000$

Three Orders:  
Measure with  
60~70dB CMOS  
Camera

Exposure (I.I. Gate)

- **Conclusions**

# Conclusions :

1. By using combination measurement of the OTR from the titanium foil screen and the fluorescence from the alumina screen, we developed two-dimensional and high dynamic-range profile monitor.
2. On the projection profiles, we obtained the beam profile of the core and the halo with around six-orders dynamicrange.
3. It was shown that the beam asymmetry or the rotation were measured with this instrument as advantage of a two-dimension.
4. These results greatly benefit to investigation of beam dynamics.

*Thank you very much for  
your attention !*
