

XFEL-MPS

**XFEL Machine Protection System
(MPS) based on uTCA**

Sven Karstensen, DESY

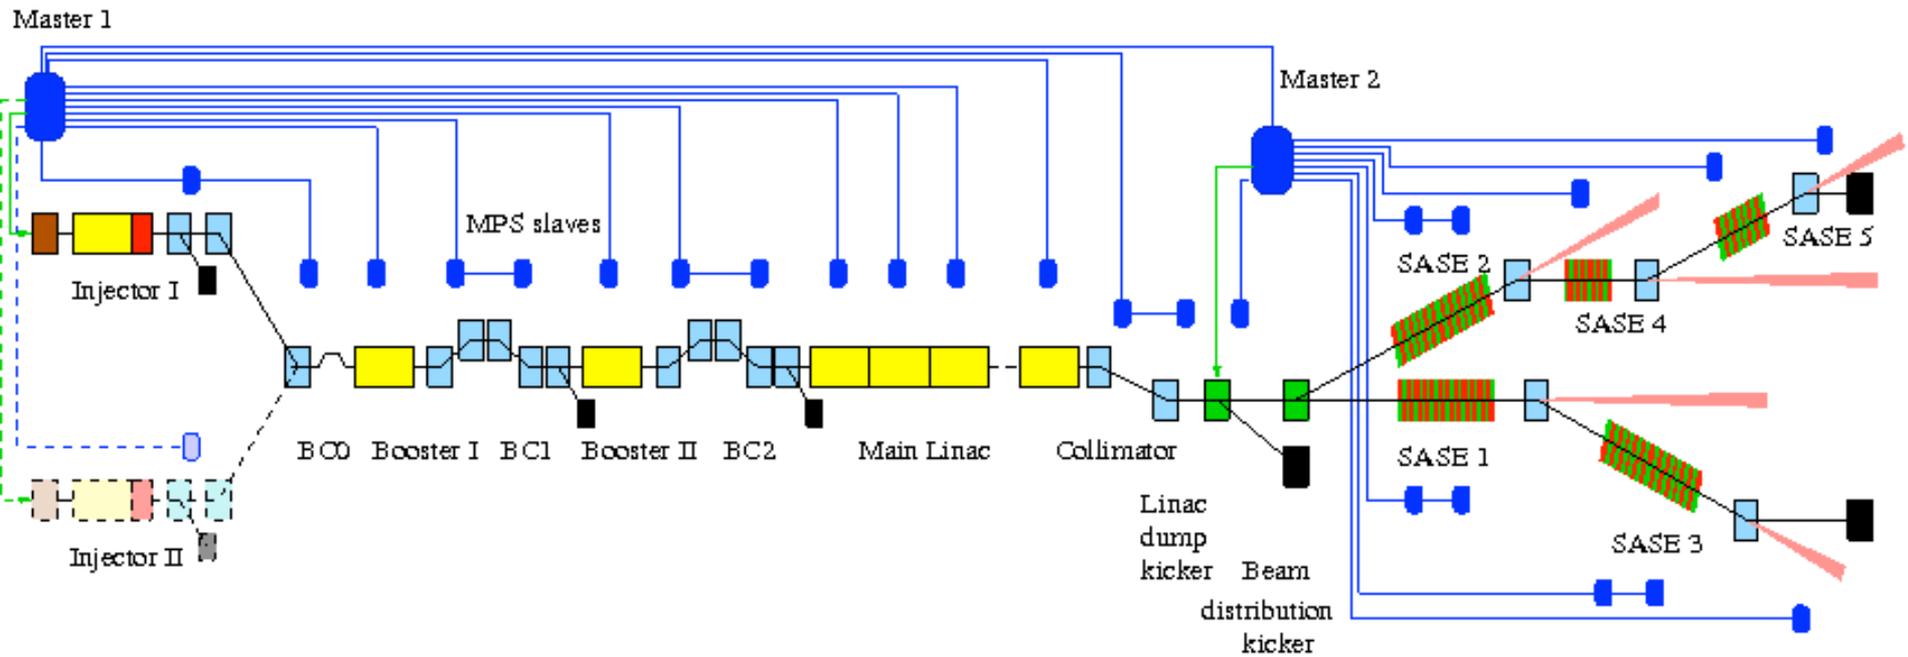

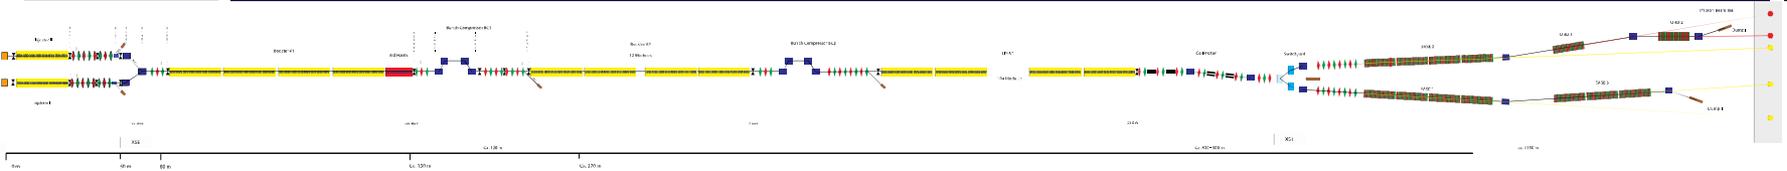

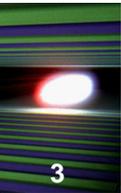

FLASH 2 and XFEL

Overall length
FLASH: 500m
XFEL: 5.4 km

MPS architecture in XFEL

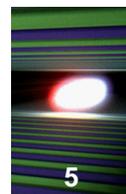

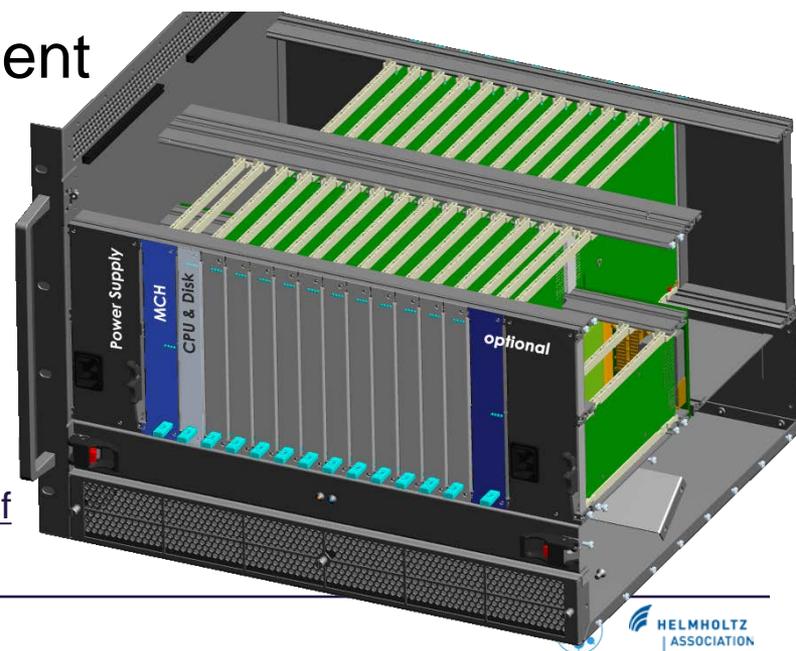

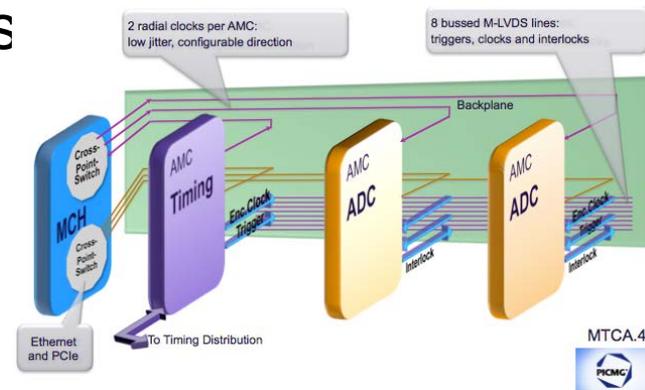

2 Masters, >120 Slaves

- Latency of signals
- Reliability of components
- Maintenance without shutdown the accelerator

MTCA.4 in general

- IPMI Management for 12 AMC modules
- Management for up to 4 Power Modules
- Fabric Switching for up to 60 Ports
 - 12 GbE minimum
 - 12 x 4 lanes XAUI, PCI-E or SRIO
- Management for up to 2 Cooling Units
- Optionally provides Shelf Management
- Front Panel Alarms
- Clock Distribution system
- Fabric Channel Uplink
- HOT SWAPable

Source: http://www.picmg.org/pdf/introduction_to_microtca.pdf
and Kay Rehlich, DESY

■ Modular + modern architecture

- Reusability + PCIe + Ethernet

■ High availability (.999 to .99999),

- Redundant power and fan optional
- IPMI management

$$A = \frac{E[\text{Uptime}]}{E[\text{Uptime}] + E[\text{Downtime}]}$$

■ High performance:

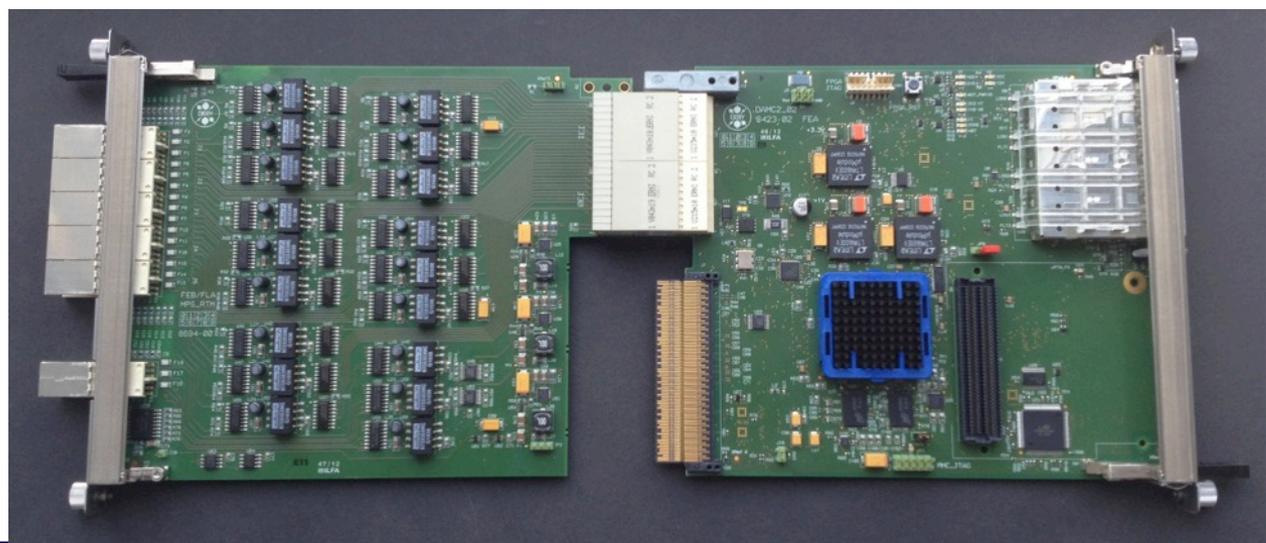

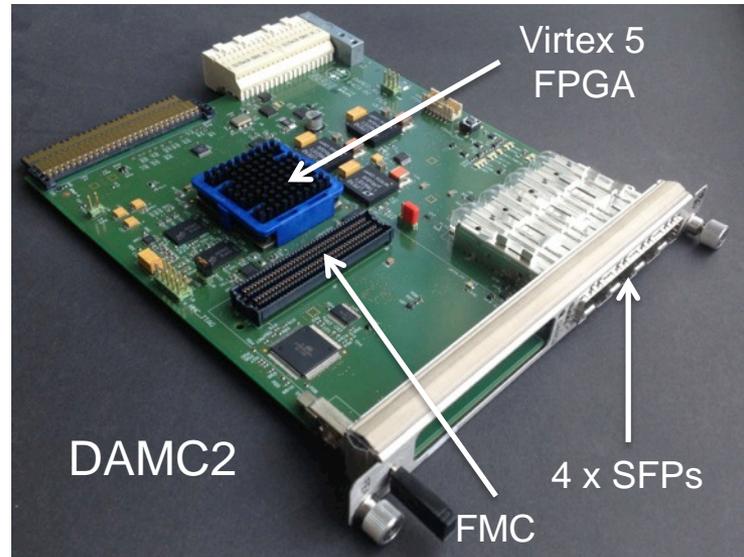

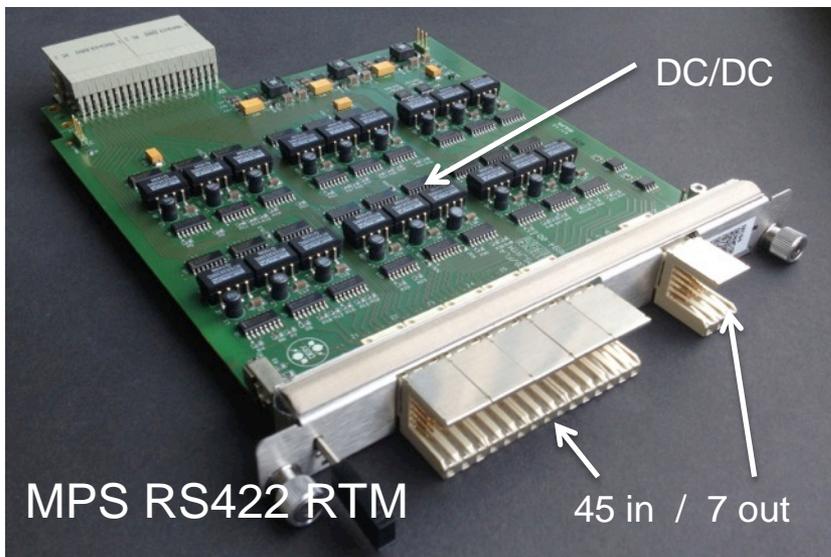

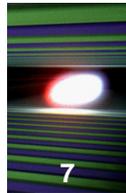

- Very low analog distortions
- 4 lanes PCIe: 400 MB/s ... 3.2 GB/s

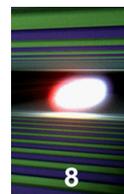

■ XFEL fast electronics will be based on MTCA.4: > 200 Crates

Courtesy to Kay Rehlich, DESY

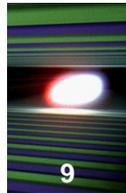

MPS MTCA components, DESY design

- Scalability
- same firmware in every DAMC2
- Every DAMC2 slave holds all information of all prior connected slaves (debugging)
- Every slave can be connected to the timing system
- Every slave can be hold one I2C driven FMC Dosimetry board
- Configurable – NOT programmable

Configuration Panel

mps_flash2_main_static_config.xml

General MPS features for every DAMC2

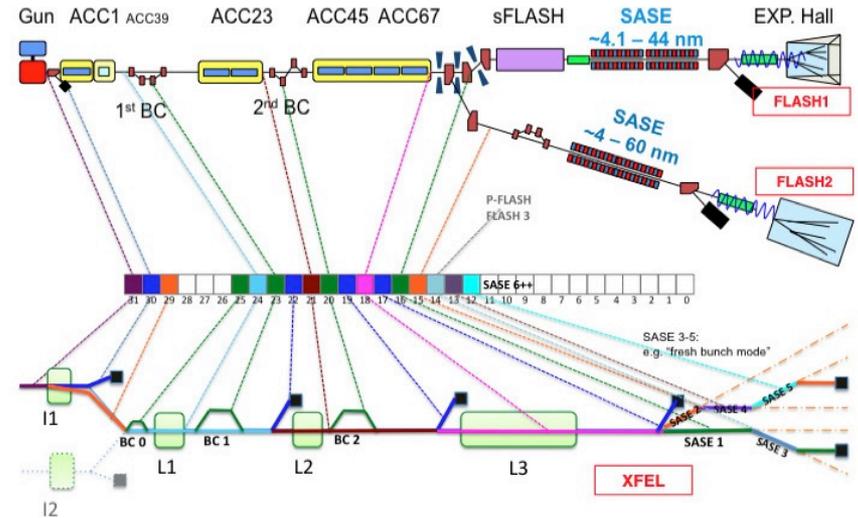

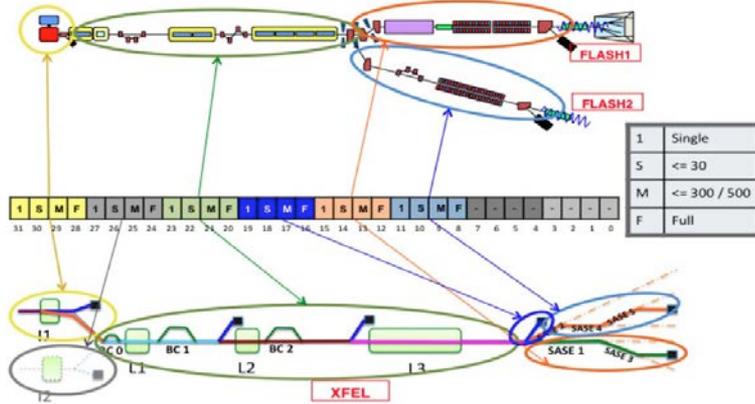

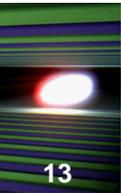

- 45 RS422 external input channels
- 3 internal input channels for FMC
- 7 RS422 output channels, 1 Backplane Output
- I²C support to FMC
- 4 SFP I/O fiber optic lines (0-4 Inputs, 0-4 outputs)
- Addressable up to 64 Sections, each equipped with 64 DAMC2 MPS modules
- Indirect redundancy
- Fast internal RS422 link from in- to outputs
- Debug Register
- LED status indicator (heart beat, server connection, initialization)

- Options for each INput channel (48):
 - Enable / disable Inputs ; Test input; Check functionality of connected systems between Macro Pulses; Pulse counter within a given time, both configurable; Beam Mode generation; Section Pattern generation; Alarm Type generation; Save each Alarm into DOOCS history

- Options for each OUTput channel (8):
 - Enable / disable Outputs ; Test output; Fast output line; Save each action into DOOCS history; Fast Output configuration on same DAMC2 board

Reaction Times in XFEL

Beam loss location	Distance from injector	Distance from dump	# of lost bunches
Injector	0 m	-1970 m	0
BC1	160 m	-1810 m	7
BC2	360 m	-1640 m	15
Linac center	1040 m	-930 m	44
Linac end	1650 m	-320 m	69
Beam distribution	2010 m	40 m	2
Last undulator	3010 m	1040 m	44

- ~ 50 bunches are inside accelerator
- Signal transport from dump to injector $20 \mu\text{s}$ (2000 m)
- ~ 50 bunches generated before laser is blocked
- Using beam dump kicker reduces the number of lost bunches inside SASE Undulator sections.

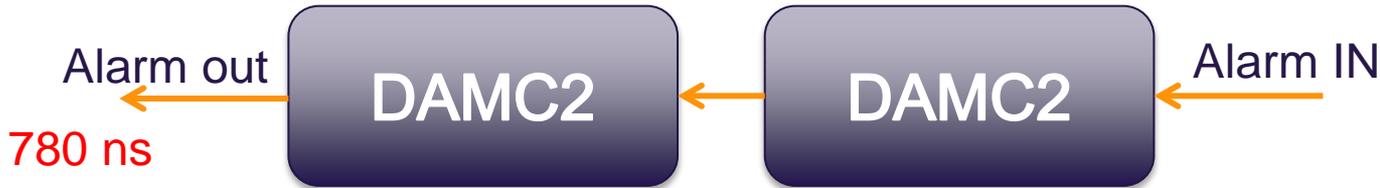

What does all information of the slides before now mean for our largest problem:
the Latency?

Latency MPS-DAMC2 boards (August 2013)

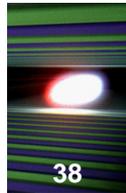

Fiber optics: unattended (5ns / m)
Speed: 1.25 GBps

Latency between DAMCs will be improved.
Factor 3 is aspired.

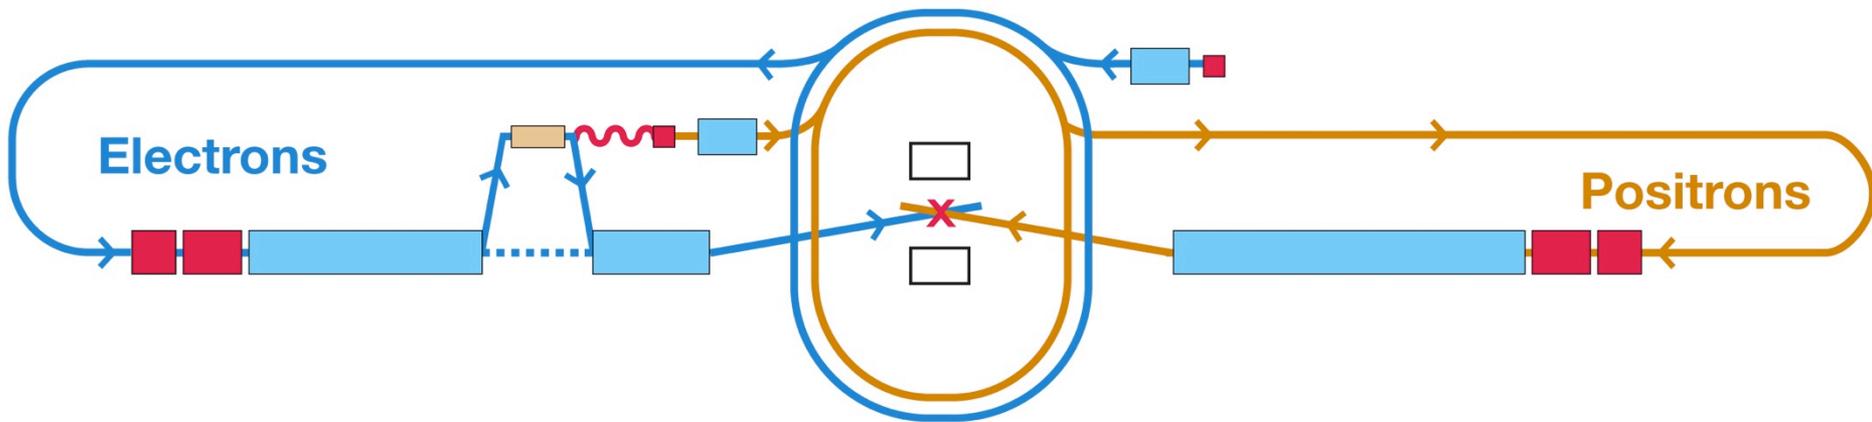

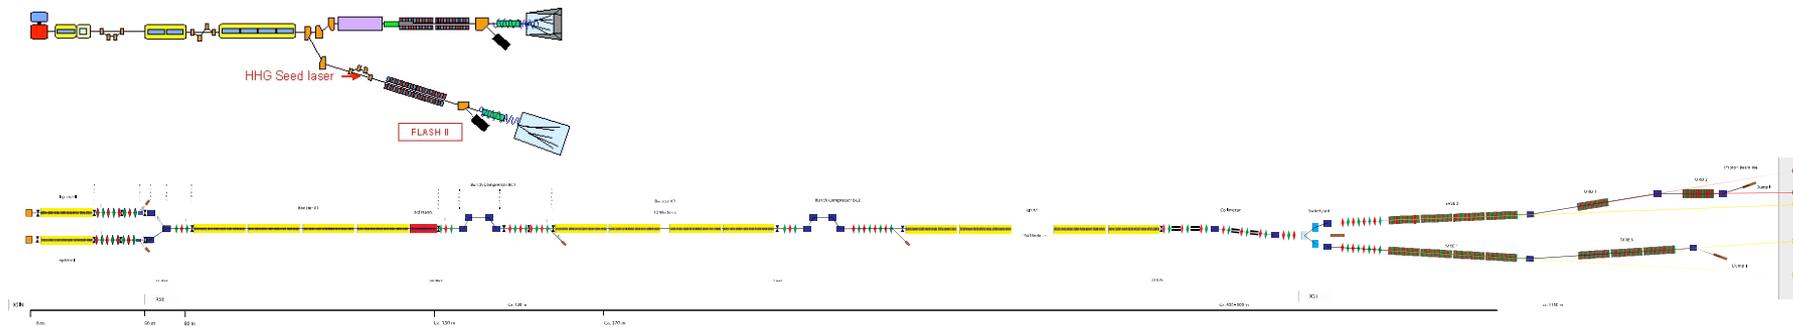

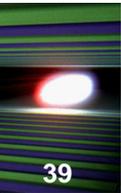

XFEL needs 20 μ sec, we peak: $1400 \text{ ns} + 2000 \text{ m} * 5 \text{ ns/m} = 11,4 \mu\text{sec}$

Thank You
