Abstract

Since the fall of 2000 proton beams are available from the source TRIPS, a high intensity microwave discharge ion source, the goal of which is the injection of a proton current of 40 mA in the following RFQ, with a rms normalized emittance lower than $0.2\pi mm-mrad$ for an operating voltage of 80 kV. *TRIPS has recently moved to LN and it is now under commissioning for the first beam.*
