- 2012 Haixiao Deng proposed the high harmonic XFELO.
- The new ideas and proposals are still coming out.

Challenges:

- High repetition electron injector.
- Heat loading of the Bragg reflection crystal mirror.
- Crystal mirrors alignment.
- Time-consuming numerical simulation.

Kai Li (SINAP)

・ロン ・四と ・ヨン ・ヨン

The traditional numerical simulation methods (GENESIS+OPC) are time-consuming and hard for XFELO theoretical research and optimization.

・ロト ・回ト ・ヨト ・ヨ

The traditional numerical simulation methods (GENESIS+OPC) are time-consuming and hard for XFELO theoretical research and optimization.

Traditional method:

- The combination of GENESIS and OPC.
- Using macro-particle sampling method.
- It takes about one month for a complete tracking.
- Time-consuming but more accuracy.

<ロト </p>

The traditional numerical simulation methods (GENESIS+OPC) are time-consuming and hard for XFELO theoretical research and optimization.

Traditional method:

- The combination of GENESIS and OPC.
- Using macro-particle sampling method.
- It takes about one month for a complete tracking.
- Time-consuming but more accuracy.

New theoretical model:

- The single-pass gain is calculated theoretically.
- Matlab codes for the cavity model.
- It takes a few minutes for a fully simulation.
- Saving time but including some approximations.

< ロ > < 同 > < 三 > < 三

The traditional numerical simulation methods (GENESIS+OPC) are time-consuming and hard for XFELO theoretical research and optimization.

Traditional method:

- The combination of GENESIS and OPC.
- Using macro-particle sampling method.
- It takes about one month for a complete tracking.
- Time-consuming but more accuracy.

New theoretical model:

- The single-pass gain is calculated theoretically.
- Matlab codes for the cavity model.
- It takes a few minutes for a fully simulation.
- Saving time but including some approximations.

イロト イ団ト イヨト イヨト

The new approach takes few minutes which makes the theoretical analysis of single-pass gain, power growth, time-dependent laser profile evolution and cavity desynchronism become more efficiently.

Theoretical model of FELO

・ロト ・回ト ・ヨト ・ヨ

Theoretical model of FELO

The radiation field inside the cavity for the (n+1)th pass at the entrance of undulator:

$$E_{n+1} = [E_n(t)g(t) + \delta E]R$$

イロト イヨト イヨト

Theoretical model of FELO

The radiation field inside the cavity for the (n+1)th pass at the entrance of undulator:

$$E_{n+1} = [E_n(t)g(t) + \delta E]R$$

Three main steps for FELO new model:

- Calculating the single-pass gain theoretically.
- Initializing the start-up radiation field.
- Simulating the laser power and profile transformation.

Image: A mathematical states and a mathem

We take the advantages of electron distribution density function to get the single-pass gain. The motion of single electron in the phase space (θ, η) is described by the pendulum equation:

$$\frac{d\theta}{dz} = 2k_u\eta$$
$$\frac{d\eta}{dz} = -\frac{\epsilon}{2k_uL_u^2}\sin\theta$$

イロト イヨト イヨト イヨ

We take the advantages of electron distribution density function to get the single-pass gain. The motion of single electron in the phase space (θ, η) is described by the pendulum equation:

$$\frac{d\theta}{dz} = 2k_u\eta$$
$$\frac{d\eta}{dz} = -\frac{\epsilon}{2k_uL_u^2}\sin\theta$$

The evolution of electron distribution function ρ is governed by the continuity equation

$$\frac{\partial \rho}{\partial z} + \dot{\theta} \frac{\partial \rho}{\partial \theta} + \dot{\eta} \frac{\partial \rho}{\partial \eta} = 0$$

<ロト </p>

We take the advantages of electron distribution density function to get the single-pass gain. The motion of single electron in the phase space (θ, η) is described by the pendulum equation:

$$\frac{d\theta}{dz} = 2k_u\eta$$
$$\frac{d\eta}{dz} = -\frac{\epsilon}{2k_uL_u^2}\sin\theta$$

The evolution of electron distribution function ρ is governed by the continuity equation

$$rac{\partial
ho}{\partial z} + \dot{ heta} rac{\partial
ho}{\partial heta} + \dot{\eta} rac{\partial
ho}{\partial \eta} = 0$$

Combining the equations above yields the following partial differential equation

$$\frac{\partial \rho}{\partial z'} + \eta' \frac{\partial \rho}{\partial \theta} + \sin \theta \frac{\partial \rho}{\partial \eta'} = \mathbf{0}$$

<ロ> (日) (日) (日) (日) (日)

¹Boscolo I, et al,. IEEE Journal of Quantum Electronics, 1982, 18(11)::1957-1961.

Assuming the initial condition of electron beam with a Gaussian distribution, the solution can be found by the method of characteristics $^{\rm 1}$

$$\rho = \frac{1}{2\pi} \frac{1}{\sqrt{2\pi}\sigma_{\eta'}} \times \exp\left\{-\frac{1}{2\sigma_{\eta'}^2} \left[\frac{\eta' \operatorname{cn}(z'; \mathcal{C}) - \sin\theta \operatorname{sn}(z'; \mathcal{C}) \operatorname{dn}(z'; \mathcal{C})}{1 - \cos^2 \frac{\theta}{2} \operatorname{sn}(z'; \mathcal{C})} - \eta'_0\right]^2\right\}$$

where $C^2 = \frac{{\eta'}^2}{4} + \cos^2 \frac{\theta}{2}$.

¹Boscolo I, et al,. IEEE Journal of Quantum Electronics, 1982, 18(11):=1957-1961. < = > < = > <= <

Assuming the initial condition of electron beam with a Gaussian distribution, the solution can be found by the method of characteristics $^{\rm 1}$

$$\rho = \frac{1}{2\pi} \frac{1}{\sqrt{2\pi}\sigma_{\eta'}} \times \exp\left\{-\frac{1}{2\sigma_{\eta'}^2} \left[\frac{\eta' \operatorname{cn}(z'; \mathcal{C}) - \sin\theta \operatorname{sn}(z'; \mathcal{C}) \operatorname{dn}(z'; \mathcal{C})}{1 - \cos^2 \frac{\theta}{2} \operatorname{sn}(z'; \mathcal{C})} - \eta_0'\right]^2\right\}$$

where $C^2 = \frac{{\eta'}^2}{4} + \cos^2 \frac{\theta}{2}$.

Using the law of conservation of energy, the single-pass power gain is

$$G = \sqrt{m_e c^2 K[JJ] k_u^{-1}} \frac{I}{c\beta} \frac{1}{2\pi \sum^2} \frac{1}{\varepsilon_0 E_0^{3/2}} \langle \Delta \eta' \rangle$$

Assuming the initial condition of electron beam with a Gaussian distribution, the solution can be found by the method of characteristics¹

$$\rho = \frac{1}{2\pi} \frac{1}{\sqrt{2\pi}\sigma_{\eta'}} \times \exp\left\{-\frac{1}{2\sigma_{\eta'}^2} \left[\frac{\eta' \operatorname{cn}(z'; \mathcal{C}) - \sin\theta \operatorname{sn}(z'; \mathcal{C}) \operatorname{dn}(z'; \mathcal{C})}{1 - \cos^2 \frac{\theta}{2} \operatorname{sn}(z'; \mathcal{C})} - \eta_0'\right]^2\right\}$$

where $C^2 = \frac{{\eta'}^2}{4} + \cos^2 \frac{\theta}{2}$.

Using the law of conservation of energy, the single-pass power gain is

$$G=\sqrt{m_ec^2K[JJ]k_u^{-1}}rac{l}{ceta}rac{1}{2\pi\sum^2}rac{1}{arepsilon_0 E_0^{3/2}}\langle \ \Delta\eta'
angle$$

Taking account of three dimensional effects, we use the equivalent formula

$$\frac{\sigma_E'}{E_0} = \sqrt{\left(\frac{\sigma_E}{E_0}\right)^2 + \left(\frac{\varepsilon\lambda_u}{4\lambda\beta}\right)^2}$$

¹Boscolo I, et al,. IEEE Journal of Quantum Electronics, 1982, 18(11):=1957-1961. < = > < = > <= <

XFELO parameters

イロン イロン イヨン イヨン

A typical XFELO is studied using parameters shown in Table bellow:

Parameter	Value	Unit
Beam energy E_0	7	GeV
Energy spread σ_E	1.4	MeV
Normalized emittance ε_n	0.2	μ m-rad
Peak current <i>I</i>	10	А
Electron bunch length σ_t	1.0	ps
Undulator period λ_u	17.6	mm
Number of undulator N_u	3000	
Laser wavelength λ	0.1	nm
Cavity loss	5%	
Bragg mirror reflectivity R	94%

Electron distribution and gain function

イロト イロト イヨト イ

Electron distribution and gain function

The electron is trapped in the "bucket" and transform its energy to light like in the IR FELO case. However, the bucket which traps the electron becomes flatter, and the energy modulation is smaller due to the relative larger electron energy.

Figure: The electron density distribution function in phase space of one slice.

Kai Li (SINAP)

March 6, 2018 10 / 20

・ロト ・日下・ ・ ヨト・

・ロト ・回ト ・ヨト ・ヨ

The radiation in the cavity start from shot noise which has significant fluctuations, becomes smooth as passing number increases, and finally reaches saturation and remain steady state.

 2 Li K, et al., Physical Review Accelerators and Beams, 2017, 20(3): 030702 \rightarrow \leftarrow \equiv \leftarrow \equiv \leftarrow \equiv \leftarrow \sim \sim \sim \sim

Motivation: the traditional way of tracking each macro-particle is time-consuming.

²Li K, et al., Physical Review Accelerators and Beams, 2017, 20(3): 030702.

Motivation: the traditional way of tracking each macro-particle is time-consuming. Solution²:

• Solving the electron density partial differential equation to get single-pass gain.

Gain function

$$G = \sqrt{m_e c^2 K[JJ] k_u^{-1}} \frac{I}{c\beta} \frac{1}{2\pi \Sigma^2} \frac{1}{\varepsilon_0 E_0^{3/2}} \langle \Delta \eta \rangle$$

²Li K, et al., Physical Review Accelerators and Beams, 2017, 20(3): 030702 🗇 + (= + (= +) = -) o

Motivation: the traditional way of tracking each macro-particle is time-consuming. Solution²:

• Solving the electron density partial differential equation to get single-pass gain.

Gain function

$$G = \sqrt{m_e c^2 K[JJ] k_u^{-1}} \frac{l}{c\beta} \frac{1}{2\pi \Sigma^2} \frac{1}{\varepsilon_0 E_0^{3/2}} \langle \Delta \eta \rangle$$

• Producing the initial electric field by sampling according to its probability distribution function.

 $^{^{2}}$ Li K, et al., Physical Review Accelerators and Beams, 2017, 20(3): 030702: \bigcirc \leftrightarrow B \leftrightarrow B \bigcirc \bigcirc \bigcirc \bigcirc

Motivation: the traditional way of tracking each macro-particle is time-consuming. Solution²:

• Solving the electron density partial differential equation to get single-pass gain.

Gain function

$$G = \sqrt{m_e c^2 K[JJ] k_u^{-1}} \frac{I}{c\beta} \frac{1}{2\pi \Sigma^2} \frac{1}{\varepsilon_0 E_0^{3/2}} \langle \Delta \eta \rangle$$

- Producing the initial electric field by sampling according to its probability distribution function.
- Simulating the evolution of the light power inside the cavity using the single-pass gain function.

Light power profile evolution equation

$$E_{n+1}(t) = [E_n(t)g(t) + \delta E(t)]R_{total}$$

Utilizing FEL oscillator with multi-stage undulators enables gain cascading in a single-pass, making it possible to achieve shorter single pulse lengths, higher peak power, and even higher pulse energy than normal FEL oscillator.³

Figure: The schematic view of cascaded FELO.

Figure: The gain of cascaded FELO calculated by new model.

XFELO

³Li K, et al., Physical Review Accelerators and Beams, 2017, 20(11): 110703 🗇 + < 🖹 + < 🖹 + - 🚊 - - 🔍

Applications: XFELO design at SCLF

The quasi-CW, FEL quality electron beams at Shanghai Coherent Light Facility (SCLF) is suitable to consider an X-ray free electron laser oscillator (XFELO) operation.
