Introduction - Stability Diagram Measurement

- One can revert polarity of transverse feedback to excite a collective mode, creating an **antidamper**.
- Antidamper supplies constant wake force on the beam, producing a coupling impedance such as (g is gain, ϕ is phase of feedback):

$$Z(\omega) \propto g e^{i\phi} \delta(\omega)$$

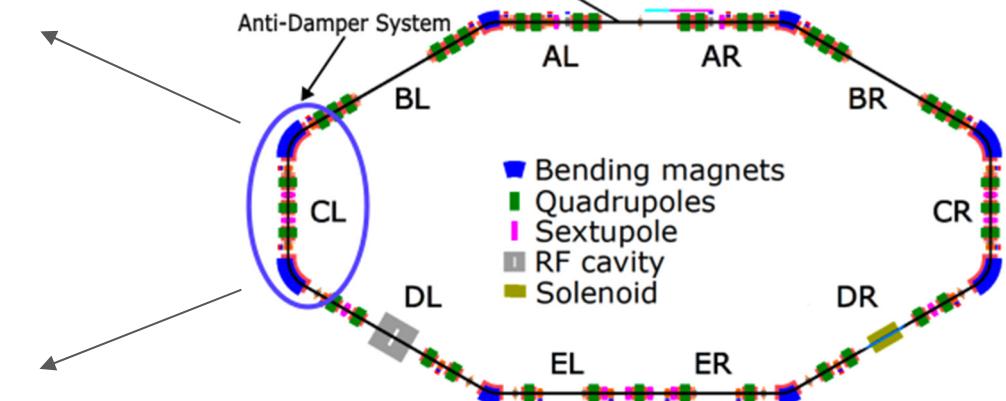

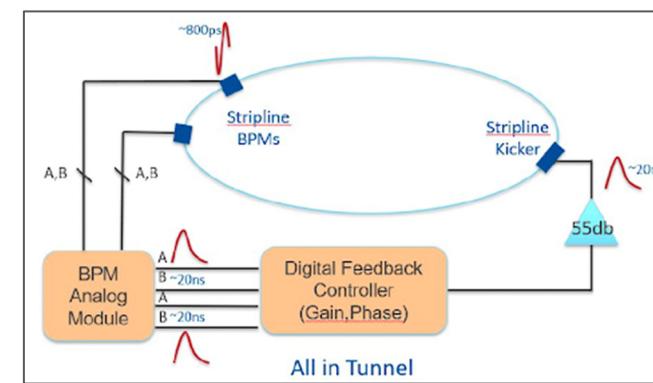

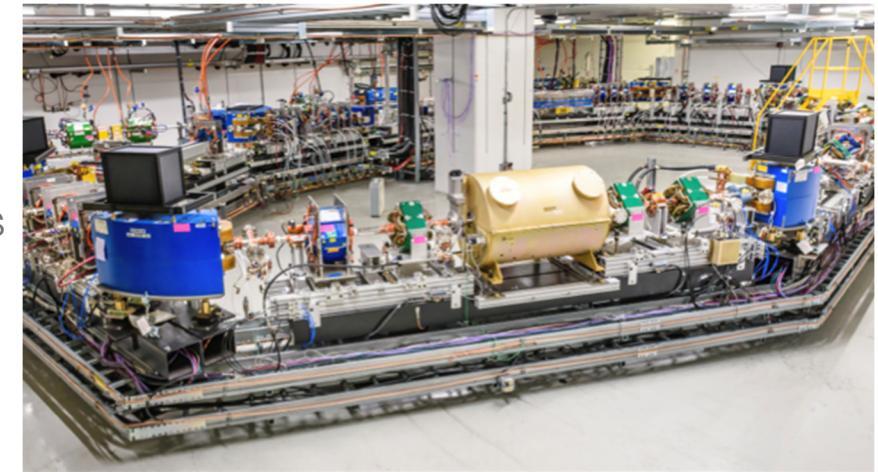

- The impedance shifts the frequencies of collective modes by (g is growth rate):
$$\Delta\omega \propto -ig e^{i\phi}$$
- So independently adjusting the gain and the phase delay, can set the feedback transfer function anywhere in the complex plane, giving a source of controlled impedance.
- Observing at what feedback gain the beam is unstable, one can obtain the **stability diagram**.

Introduction - Experiment at IOTA at Fermilab

- We are working towards measuring the stability diagram at the Integrable Optics Test Accelerator (IOTA) at Fermilab.
- Beam gets kicked by the kicker. The total phase from the two BPMs is adjusted to supply the phase change.
- The stripline BPMs measure the beam position and are ~ 110 degrees in phase advance apart so that (x,x') can be measured in a single Turn.
- Results from BPMs used to adjust gain/phase until instability is observed.

Current Results

- The first experimental goal was to incite and measure the growth rate of an instability with the anti-damper.
- A sweep through the phases was then performed towards making a stability diagram.
- The growth rates at instability were analyzed as a function of the experimental kick of the beam.
- The linear fits can be extrapolated to get the instability growth rate at an experimental kick threshold.

Next Steps and Acknowledgments

- Data collection began just two weeks ago and is being completed this week, with tight sweeps of phase and gain.
- Will obtain and study stability diagrams for ranges of octupole settings, as well as in both the horizontal and vertical plane.
- Additionally, the results from IOTA will expand upon those from the LHC to investigate the impact of the machine's impedance on the stability diagram.
