ABSTRACT

The CTA Observatory will comprise more than 100 telescopes and calibration devices that need to be centrally managed and synchronized by a complex SCADA system, named Array Control and Data Acquisition (ACADA). The quality level of ACADA system is crucial for maximizing the efficiency of the CTA operations. The Quality Assurance (QA) strategy adopted by the ACADA team must guarantee for each phase of the project the required level of quality in the design, implementation, testing, integration, configuration, usage and maintenance of the ACADA product.

QA MANAGEMENT ORGANIZATION

The roles and responsibilities of the personnel assigned to the ACADA [1] Quality Assurance process are individuated based on the ACADA Management Plan and ACADA Software Development Life Cycle (SDLC) [2].

SQA Top-Management Body (SQA – TMB)

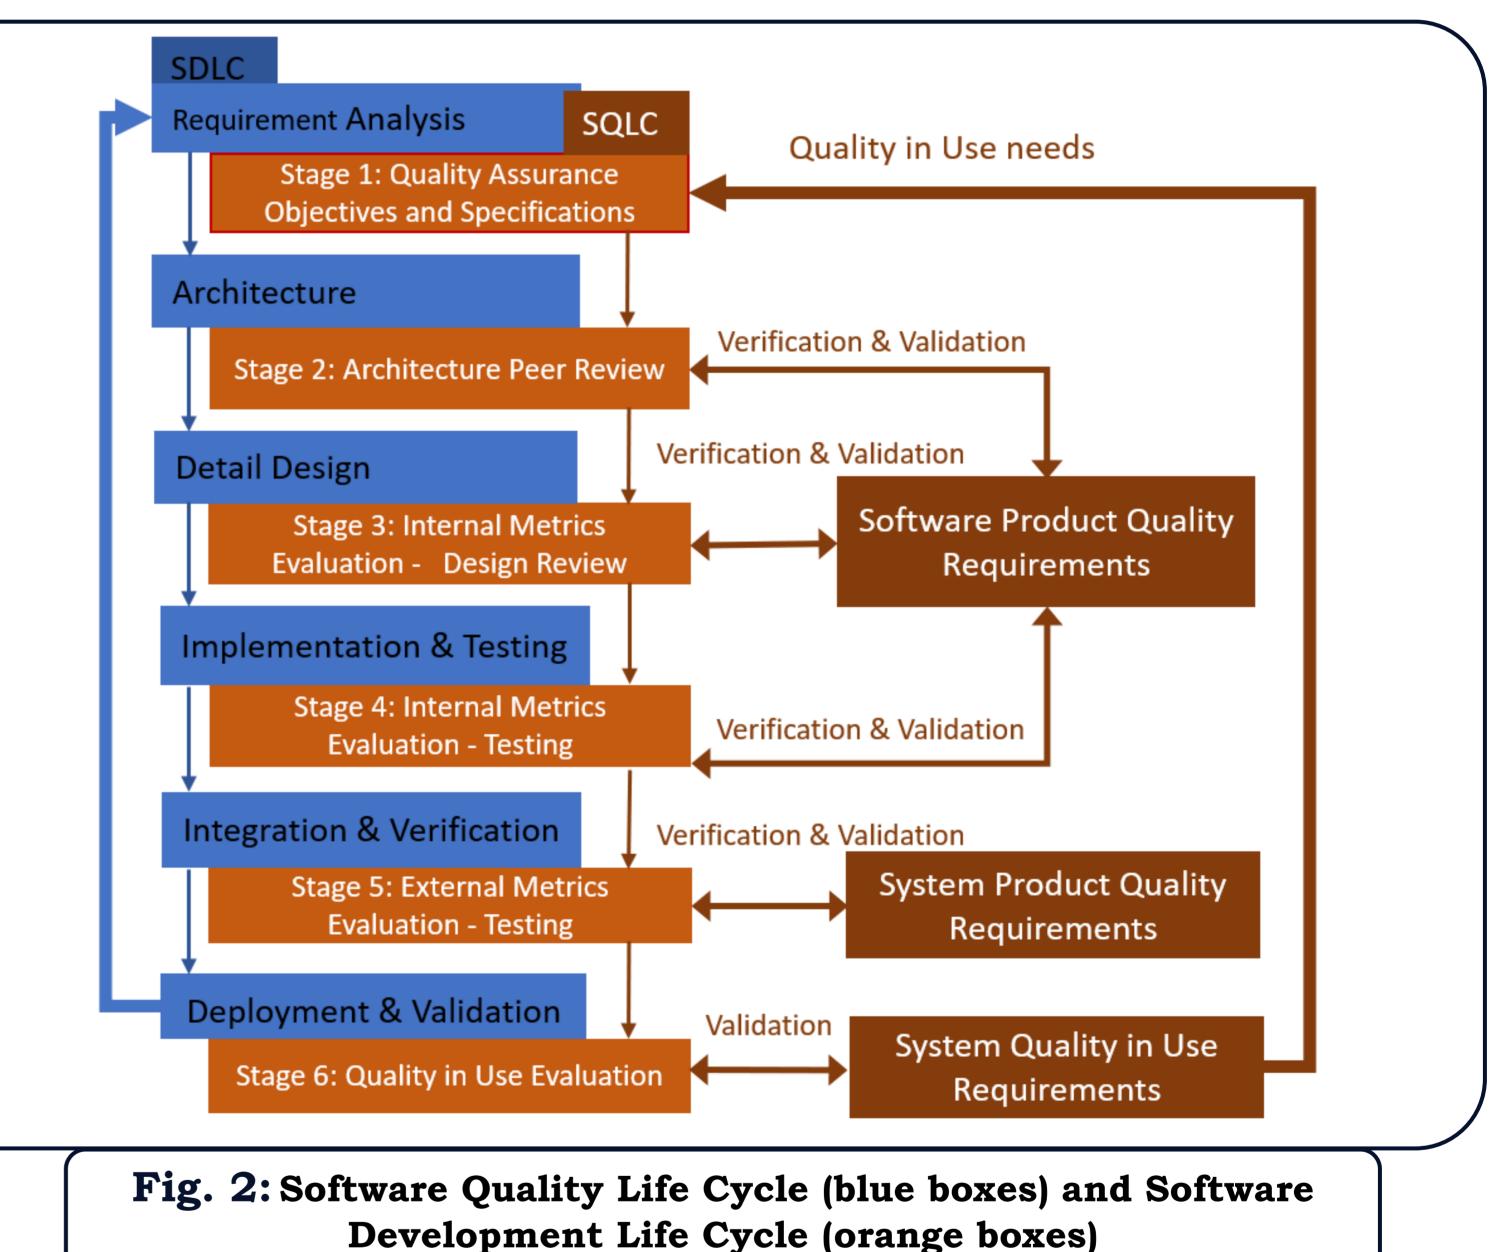

Managing the top-level responsibilities of the ACADA quality process assurance in the global quality project framework

SQA Management Body (SQA – MB)

- Definition of the SQA program and budget
- Evaluation of SQA manpower
- Supervision and control of the planned activities for

QUALITY ASSURANCE LIFE CYCLE

ACADA Quality Life Cycle (SQLC): Define Product and Process QA tasks to be performed coherently with the ACADA SDLC.

SQA Professional Body (SQA – PB)

- Technical implementation of quality metrics
- Execution of quality tests

SQA Validation & Verification Body (SQA - VVB)

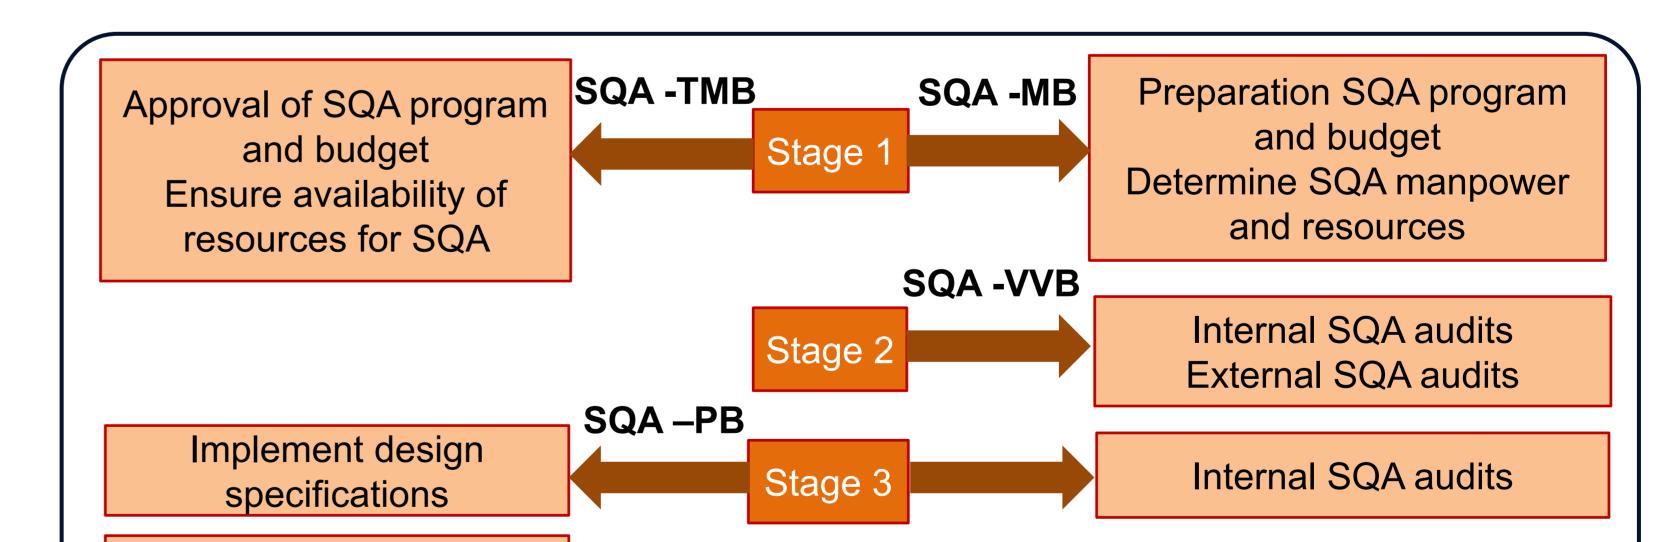

Supervise the execution of the quality tests
Organize audits to evaluate the quality reports

Fig. 1: ACADA QA Roles & Responsibilities.

PRODUCT ASSURANCE

The adopted Product Quality and Quality in Use models for ACADA follow the quality standard [3]:

- The Product Quality Model focuses on the quality of the work package by measuring the quantities related to the internal and external metrics.
- The Quality in Use metrics measure the intrinsic properties of the system, including software, hardware, communication and users. The Product assurance activity is coherently applied at each stage of the SDLC.

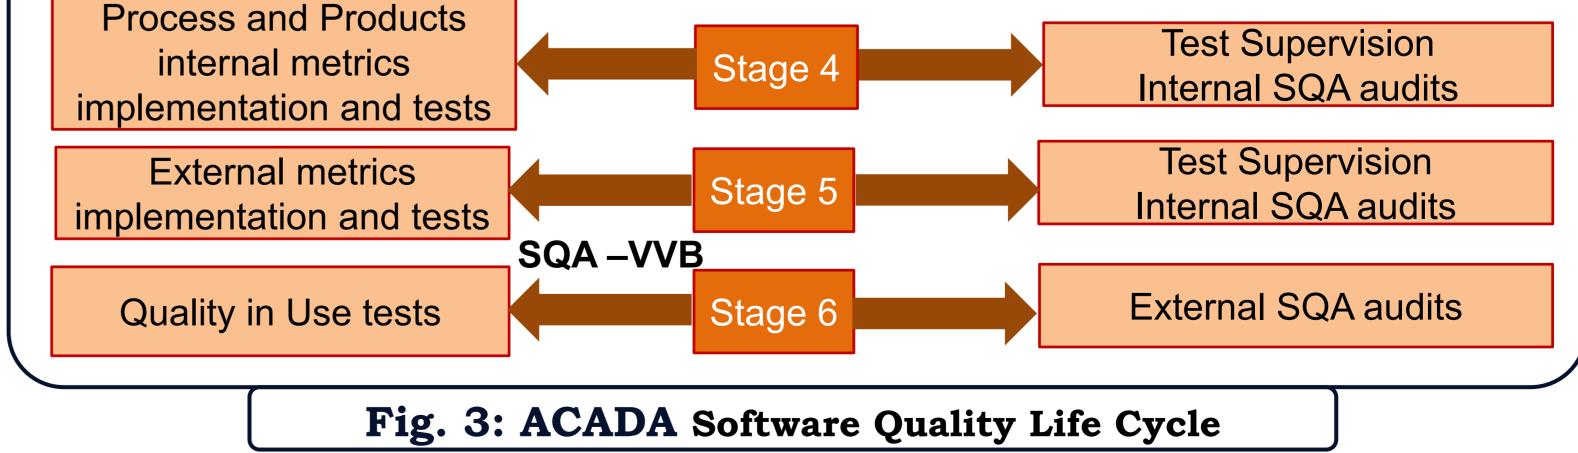

PROCESS ASSURANCE

- The process assessment actions defined for the realization of ACADA are:
- Supervision of the SQA activities
- Supervision of periodic reports to assess the achievement of quality objectives
- Review of progress of the SQA activity
- Final approval of the quality of software products
- The tasks are conducted based on the ACADA development activity schedule.

ACKNOWLEDGEMENTS

We gratefully acknowledge financial support from the agencies and organizations listed here: www.cta-observatory.org/consortium_acknowledgments
