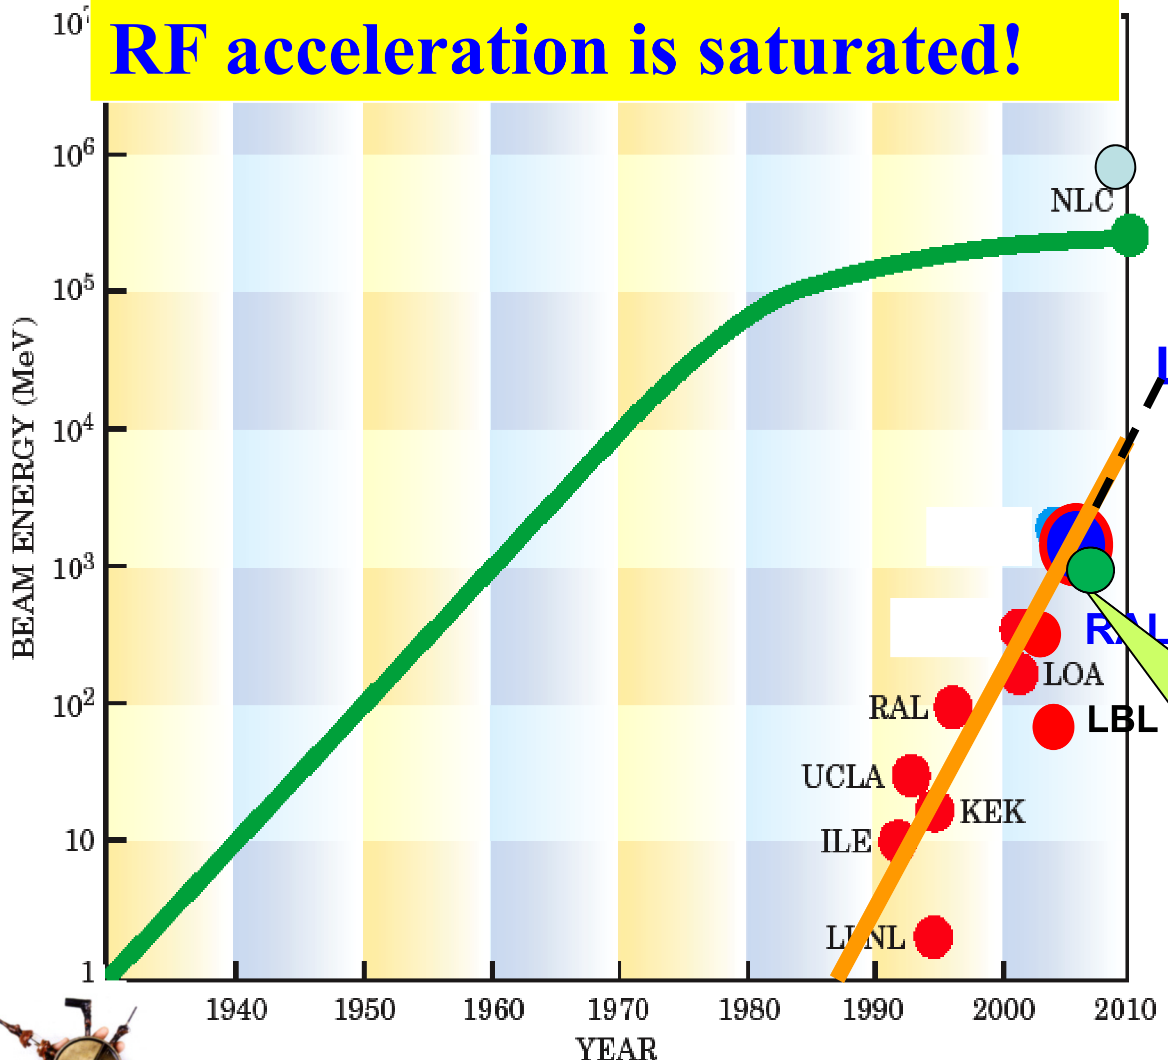
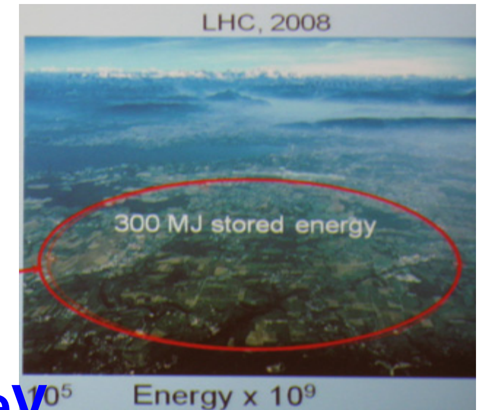
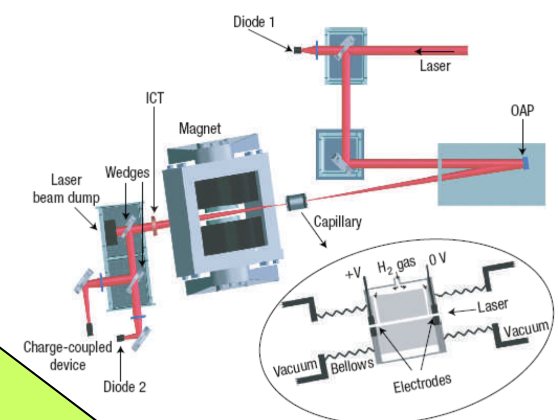
Why and What is laser acceleration?

Particle energy: From eV→MeV→GeV → TeV…

RF acceleration is saturated!







Gradient is thousand
Times higher!

Laser Electron Accelerator

Laser Electron Accelerator

T. Tajima and J. M. Dawson
Department of Physics, University of California, Los Angeles, California 90024
(Received 9 March 1979)

An intense electromagnetic pulse can create a weak of plasma oscillations through the action of the nonlinear ponderomotive force. Electrons trapped in the wake can be accelerated to high energy. Existing glass lasers of power density 10^{18}W/cm^2 shone on plasmas of densities 10^{18} cm^{-3} can yield gigaelectronvolts of electron energy per centimeter of acceleration distance. This acceleration mechanism is demonstrated through computer simulation. Applications to accelerators and pulsers are examined.

Tabletop Accelerator

In December, scientists at Lawrence Berkeley National Lab announced a new world record for a compact particle accelerator. The team used a tabletop-sized laser-plasma accelerator to energize electrons up to 4.25 GeV. Though not nearly as powerful as the massive LHC, the tiny BELLA accelerator can do in about one meter what would take CERN 1,000 meters. Physicists hope that this emerging compact accelerator technology will pave the way to new generations of particle colliders.

Nobel prize in 2018

Toshiki Tajima

At Lawrence Berkeley National Laboratory in California, a petawatt-class laser at the Berkeley Lab Laser Accelerator (BELLA) facility is used to accelerate electrons to 4.2 GeV over a distance of 9 cm [78]. This is an acceleration gradient of at least two orders of magnitude higher than what can be obtained with RF technology. That there are many remaining challenges before laser accelerators can be used for medical applications is well understood [79].

Target Normal Sheath Acceleration for ions

Laser-driven ion accelerators for tumor therapy revisited

Ute Linz[1,*] and Jose Alonso[2,†]
[1]*Forschungszentrum Jülich, D-52425 Jülich, Germany*
[2]*Lawrence Berkeley National Laboratory, Berkeley, California 94720, USA*
(Received 2 August 2016; published 29 December 2016)

Ten years ago, the authors of this report published a first paper on the technical challenges that laser accelerators need to overcome before they could be applied to tumor therapy. Among the major issues were the maximum energy of the accelerated ions and their intensity, control and reproducibility of the laser-pulse output, quality assurance and patient safety. These issues remain today. While theoretical progress has been made for designing transport systems, for tailoring the plumes of laser-generated protons, and for suitable dose delivery, today's best lasers are far from reaching performance levels, in both proton energy and intensity to seriously consider clinical ion beam therapy (IBT) application. This report details these points and substantiates that laser-based IBT is neither superior to IBT with conventional particle accelerators nor ready to replace it.

DOI: 10.1103/PhysRevAccelBeams.19.124802

following challenges:

(1) scaling laws for proton energy with laser power,
(2) shot-to-shot reproducibility to the few-percent level,
(3) improving proton flux by at least an order of magnitude,
(4) development of techniques for accurate dose control and cutoff

Characteristics of Laser Driven Ion Beam

- Large energy spread: 20%~100%
- Large diverge angle~10°
- Small emittance ~0.1 π mm.mrad
- Small initial size, spot source ~5μm
- Short pulse duration ~a few ps
- High peak current ~ 10^9-10^{12}ppp, KA

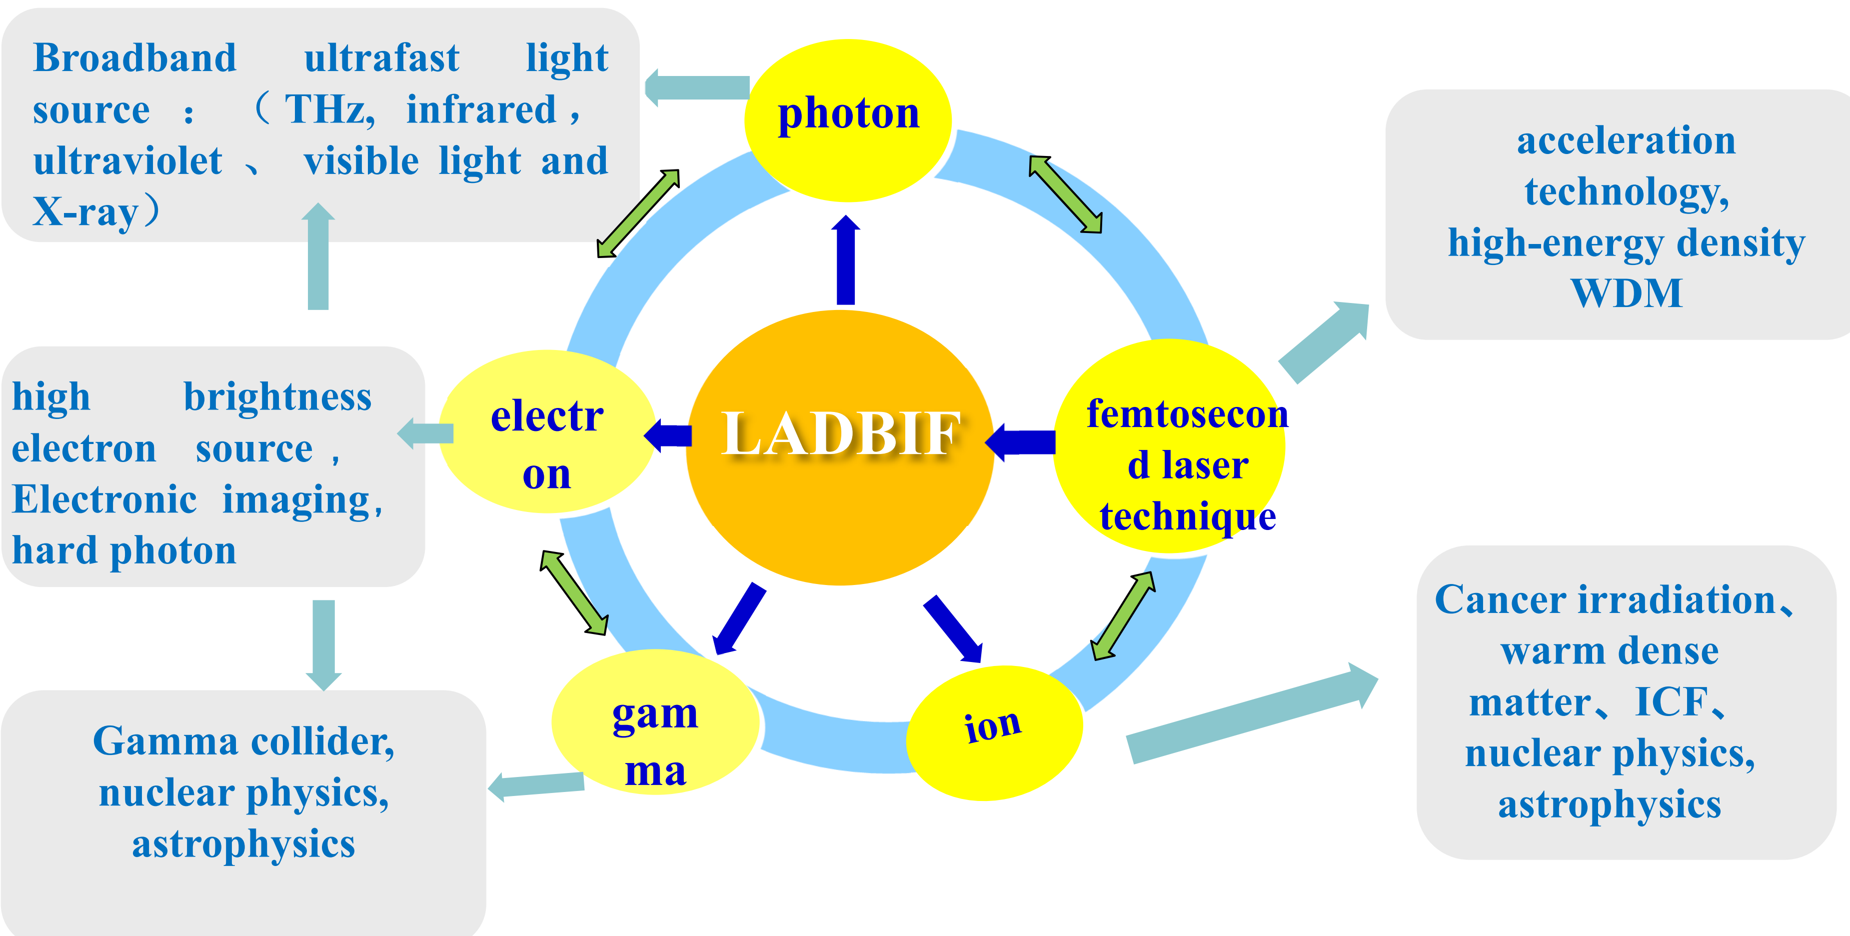
Future Plan

Femtosecond LAser Driven multiple Beam Integrated Facilities, LADBIF

in China's 14th Five-Year Plan, operated by BLAIC/PKU



Summary

- ✓ Radiation Pressure Acceleration with phase stability was proposed, it can efficiently accelerate proton/ions.
- ✓ A compact laser plasma accelerator (CLAPA) at Peking University has been built.
- ✓ 3-15 MeV proton beams with 100pC charge have been generated with stability better than 3% by using plastic targets.
- ✓ With the beam line, laser accelerator of <10MeV proton beams with 1% energy spread and 1-30 pC has been achieved.
