## Transverse to longitudinal emittance exchange

M. Cornacchia\* and P. Emma†

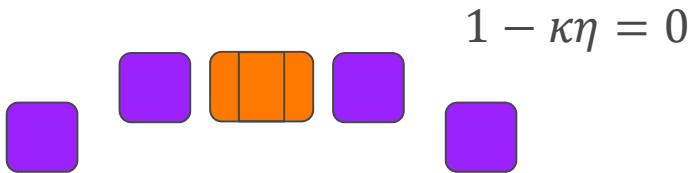

*Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309*

(Received 13 June 2002; published 29 August 2002)

A scheme is proposed to exchange the transverse and longitudinal emittances of an electron bunch. A general analysis is presented and a specific beam line is used as an example where the emittance exchange is achieved by placing a transverse deflecting mode radio-frequency cavity in a magnetic chicane. In addition to reducing the transverse emittance, the bunch length is also simultaneously compressed. The scheme has the potential to introduce an added flexibility to the control of electron beams and to provide some contingency for the achievement of emittance and peak-current goals in free-electron lasers.
