The history of superconductive ID fabrication in the Budker INP

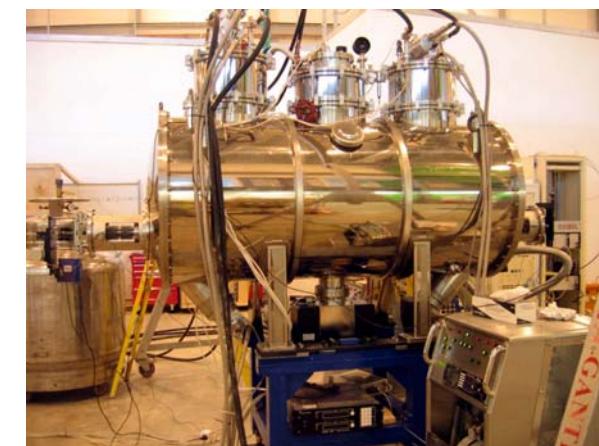

- 1979 - first in the world 3.5 Tesla superconducting 20 pole wiggler (SCW) for VEPP-3
- 1984 - 5 pole 8 Tesla superconducting wiggler for VEPP-2
- 1985 - 4.5 Tesla Superconducting Wave Length Shifter (WLS) for Siberia-1, Moscow
- 1992 - 6 Tesla Superbend (SB) prototype for compact storage rings
- 1996 - 7.5 Tesla superconducting WLS for PLS, South Korea
- 1997 - 7.5 T superconducting WLS with fixed point of radiation for CAMD-LSU (USA)
- 2000 - 7 Tesla WLS with fixed radiation point for BESSY-2, Germany
- 2000 - 10 Tesla WLS for Spring-8, Japan
- 2001 - 7 Tesla WLS with fixed radiation point for BESSY-2, Germany
- 2002 - 3.5 Tesla 49 pole SCW for ELETTRA, Italy
- 2002 - 7 Tesla 17 pole SCW for BESSY-2, Germany
- 2004 - 9 Tesla Superbend for BESSY-2, Germany
- 2005 - 13 Tesla superconducting solenoids for VEPP-2000
- 2005 - 2 Tesla 63 pole SCW for CLS, Canada
- 2006 - 3.5 Tesla 49 pole for DLS, England
- 2006 - 7.5 Tesla 21 pole SCW for Siberia-2, Moscow
- 2007 - 4.2 Tesla 27 pole SCW for CLS, Canada
- 2009 - 4.2 Tesla 49 pole SCW for DLS, England
- 2009 - 4.1 Tesla 35 pole SCW for LNLS, Brasil
- 2010 - 2.1 Tesla 119 pole SCW for ALBA, Spain
- 2012 - 4.2 Tesla SCW for Australian Light Source
- 2012 - 7.5 Tesla SCW for CAMD-LSU (USA)
- 2013 - SCW for ANKA
- 2013 - SCW for ANKA & CLIC with indirect cooling
- 2013 - 2 SCW for Siberia-2,

Indirect cooling conception

Direct cooled magnet (magnet in bath cryostat)

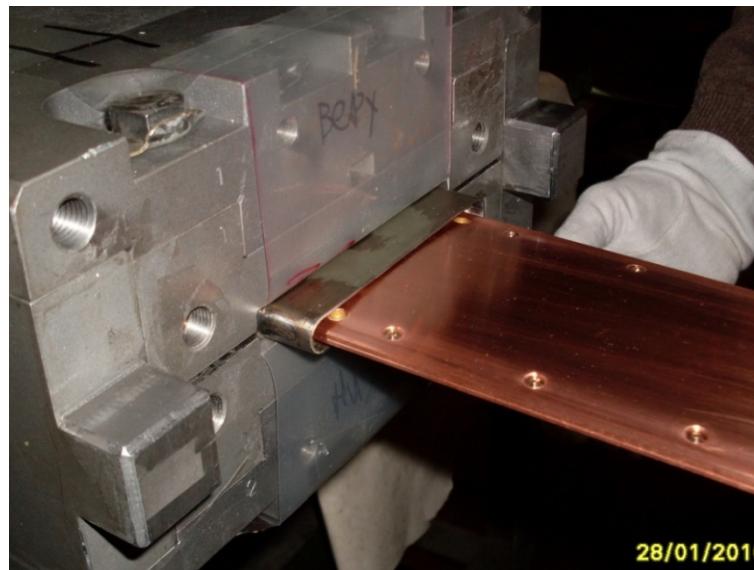

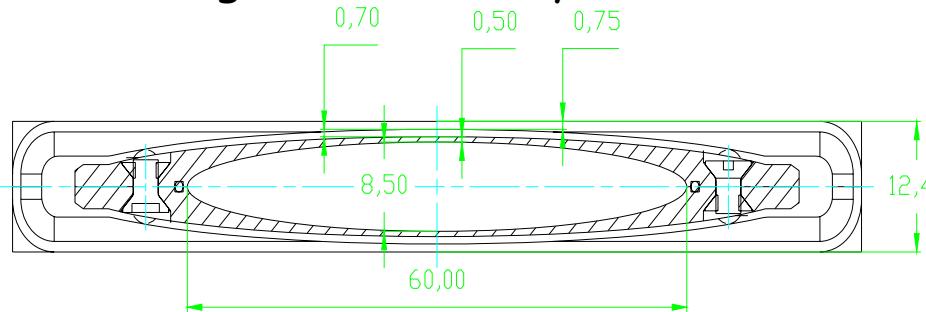

Indirect cooled magnet (magnet in isolation vacuum)

Advantages of indirect cooling

- Easy access to the magnetic system and to the beam vacuum chamber
- Possibility for exchanging of the elements of magnetic system (and whole system) without complex operation
- Possibility for exchanging the beam vacuum chamber
- Possibility for installing of the wigglers in the halls with lower ceilings
- Effective using of the magnetic gap

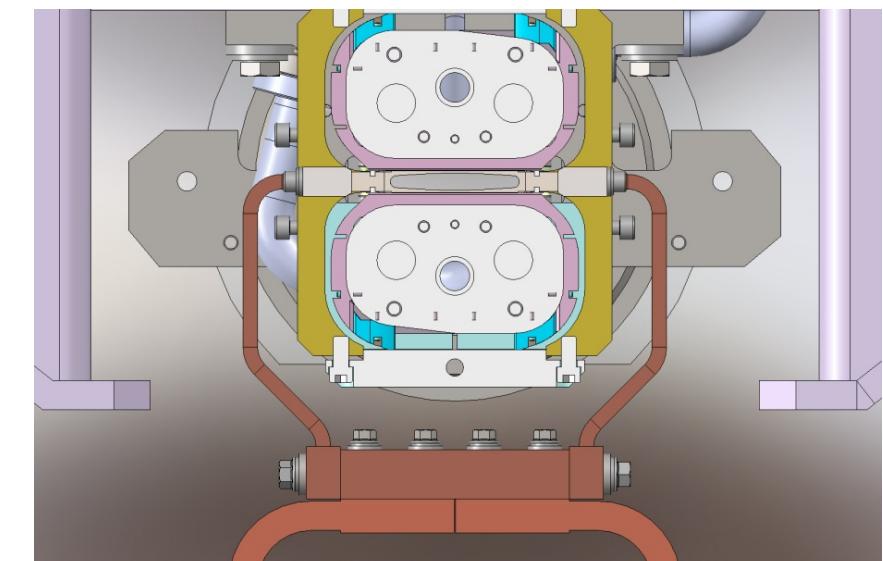

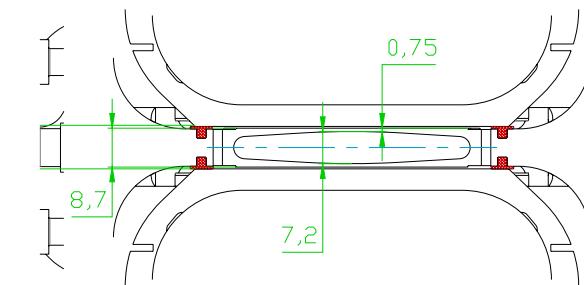

Pole gap g and electron beam vertical aperture

Direct cooling magnet with liquid helium (magnet in bath cryostat)

Pole gap = V aperture + 4 mm

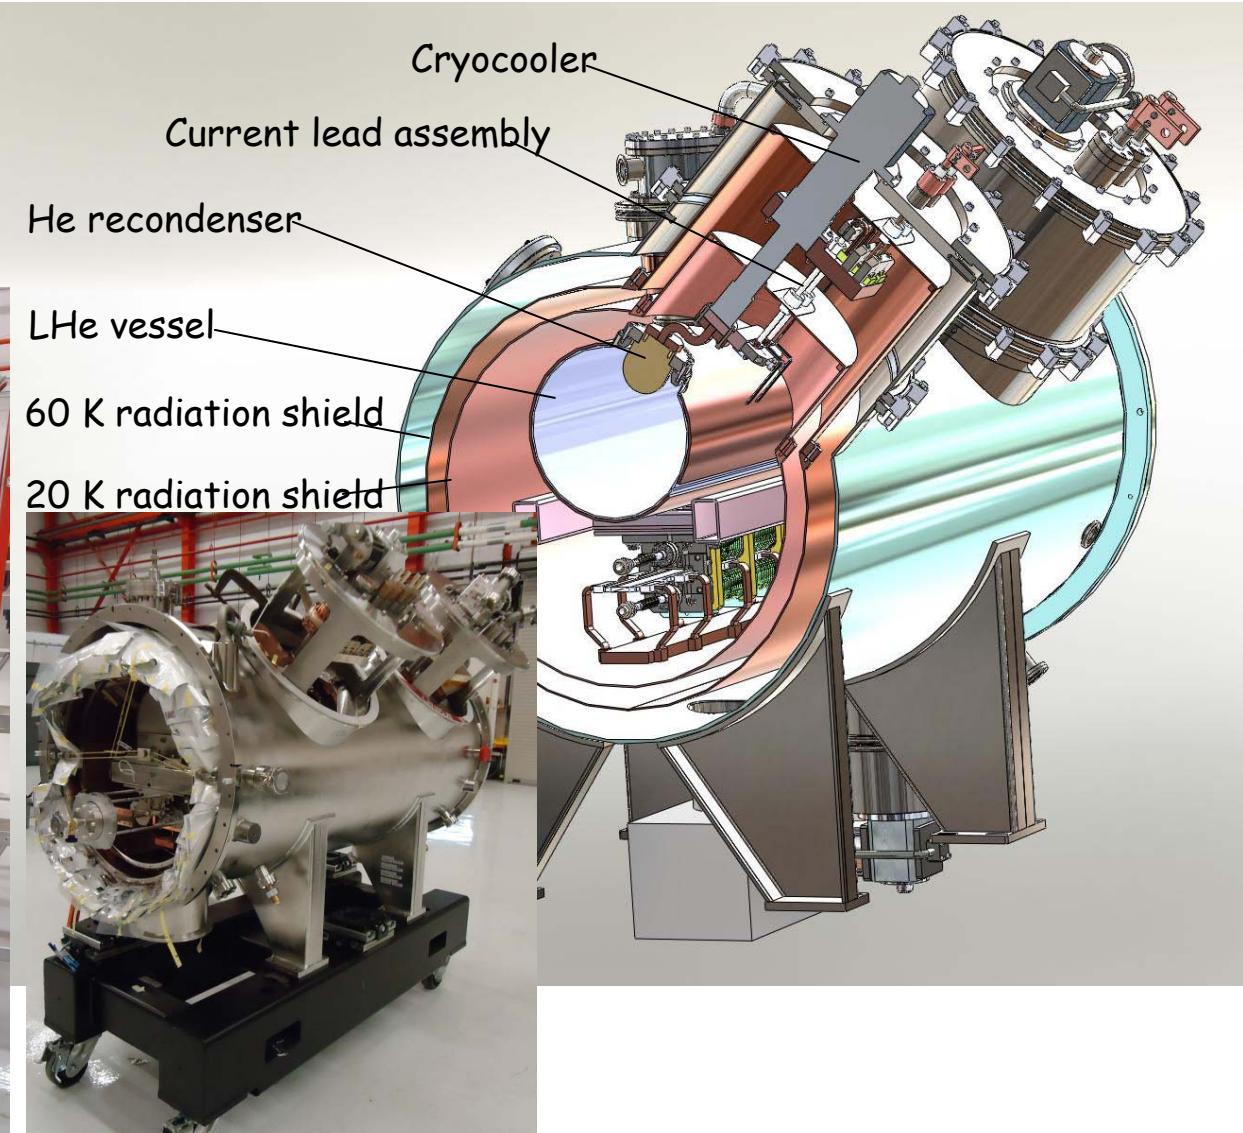

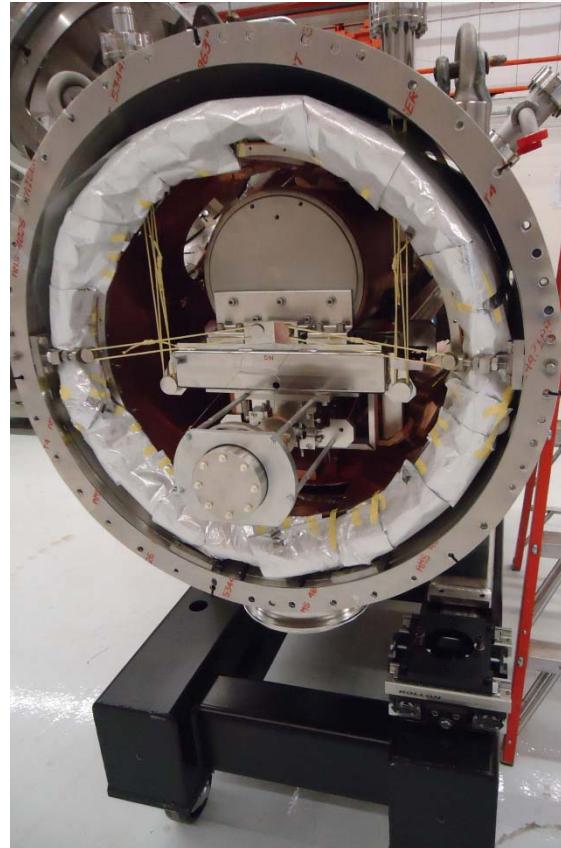

Indirect cooling magnet
Magnet in insulating vacuum

Pole gap = V aperture + 1.5 mm

CLIC Damping ring

Choice of the technology for CLIC damping wiggler

Wiring type

Superconductive technology

NiTi

Nb₃Sn

Vacuum pipe coating, e-cloud mitigation

NEG, C, NiB etc

Wiggler parameters

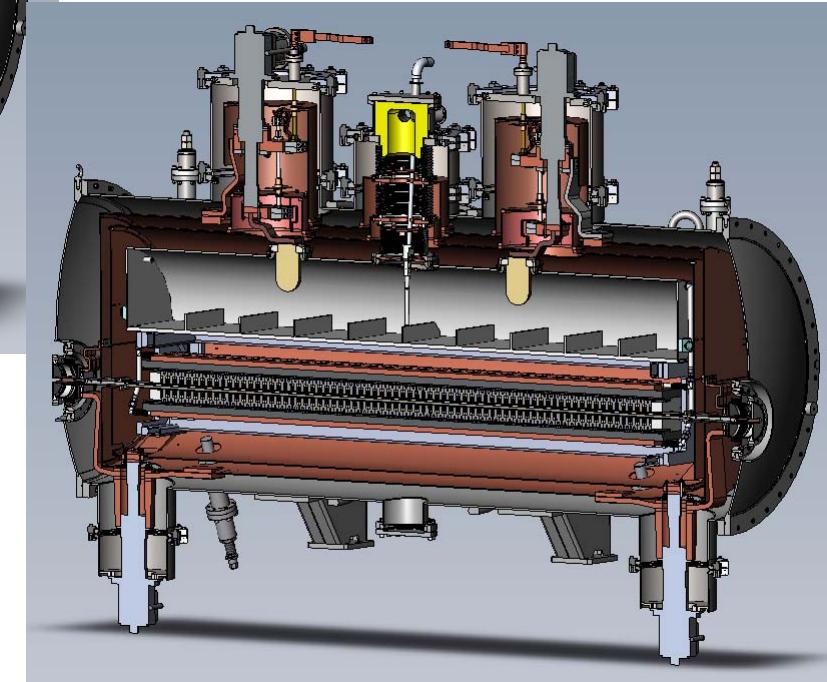

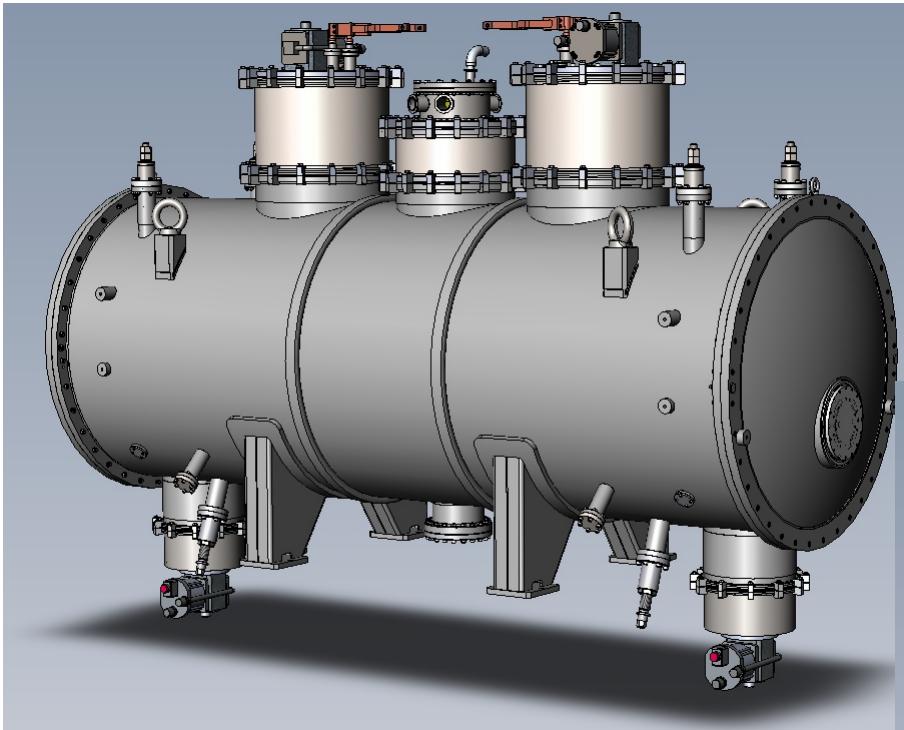

Total number of poles	72
Number of main poles	68
Number of additional poles	4
Period	51 mm
Magnetic gap	18 mm
Peak magnetic field on the main poles	3 T
Currents	243 A x4
Stored energy	60 kJ
Aperture	13 mm x

Additional requirements

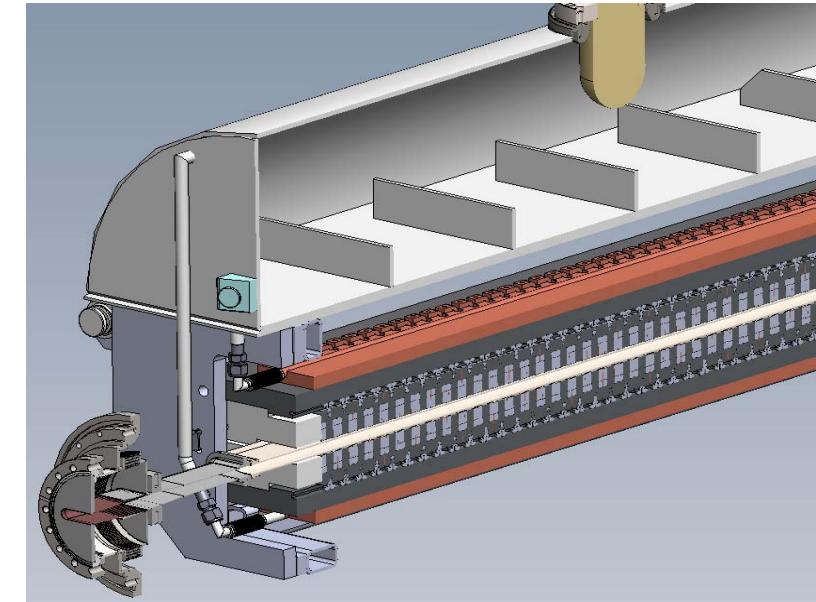

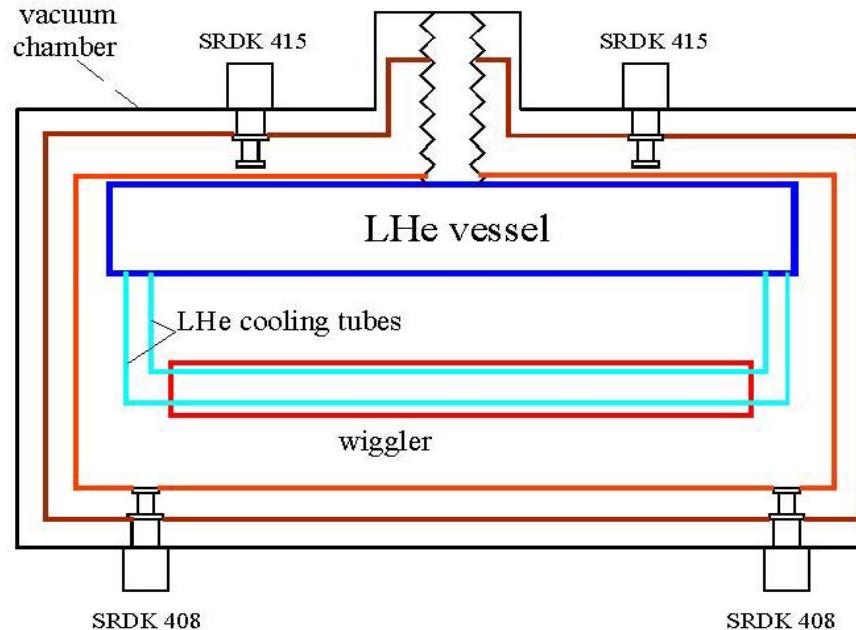

- Possibility for exchanging of the magnetic system in future
- Possibility for exchanging of the beam vacuum pipe
- Heating vacuum pipe till 90 K
- Heating vacuum pipe with power load up to 50 W (with keeping temperature about 40 K)
- Possibility of activation of the NEG-coating (up to 200° C)

Superconducting wire parameters and calculated field profile

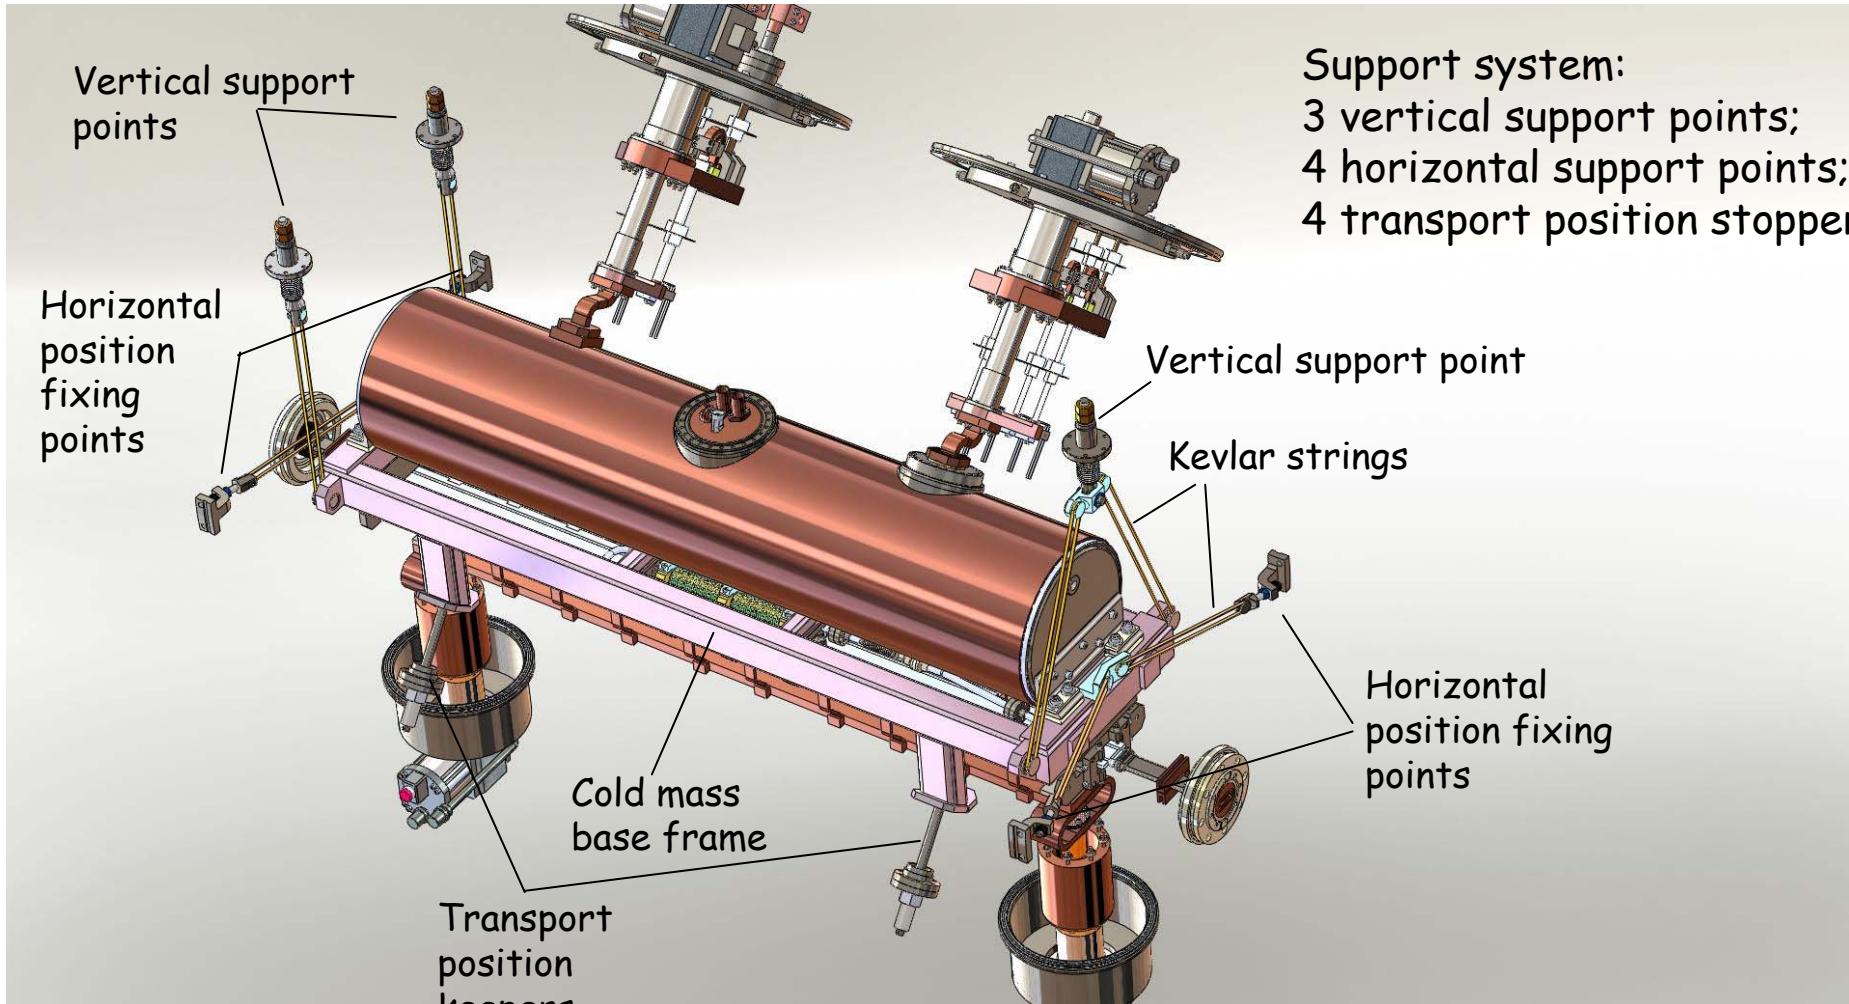

Diameter(mm)	0.85 (0.91 with insulation)
Ratio of NbTi:Cu	1.4
Number of NbTi filaments	312
Critical Current of modified/enhanced SC wire (A)	~520 (at 7 Tesla, 4.2K)

Общий вид расчетной модели и прототипа

Cold mass support structure

Cold mass is hung on Kevlar strings attached to the cold mass support base on one side and to the vacuum vessel on the other.

Schedule and plans

ANKA/CLIC -wiggler

- Conceptual design report May, 2012
- Short prototype testing Oct., 2012
- Full design report Oct., 2012
- Fabricating June, 2013
- Factory acceptance tests Aug., 2013
- Site acceptance test,
commissioning Sept., 2013

Common plan for cooling conception development

- Fabrication of the similar wiggler for light source "Siberia-2"
- Heat pipes cooling conception toward helium free ID
- Heat pipes as a heat keys for cooling commutation, effective initial cooling of the system
